Til Medicinrådet

På vegne af BeOne Medicines vil jeg takke for muligheden for at give en tilbagemelding på udkastet til vurderingsrapporten for tislelizumab i kombination med platin- og fluoropyrimidin-baseret kemoterapi som har indikation til førstelinjebehandling af voksne patienter med HER-2-negativ, lokalt fremskreden, ikke-resektabel eller metastatisk mave- eller gastroøsofageal (G/GEJ) adenokarcinom, hvis tumorer udtrykker PD-L1 med en tumorareal-positivitetsscore (TAP) ≥ 5 %.

BeOne Medicines ønsker ligeledes at takke for en god og konstruktiv dialog med sekretariatet igennem processen og vi har noteret at Medicinrådet synes enige i de antagelser, der er valgt i ansøgningen.

BeOne Medicines har et udtrykt ønske om hurtig adgang til behandling for patienter i Danmark og ser således ikke anledning til yderligere kommentarer.

Vi ser frem til Medicinrådets anbefaling af tislelizumab.

Med venlig hilsen

Nicolai Bendtsen

1. Regulatory information on the medicine

Overview of the medicine	
Proprietary name	Tevimbra®
Generic name	Tislelizumab
Therapeutic indication as defined by EMA	Tevimbra®, in combination with platinum and fluoropyrimidine-based chemotherapy, is indicated for the first-line treatment of adult patients with HER-2-negative locally advanced unresectable or metastatic gastric or gastroesophageal junction (G/GEJ) adenocarcinoma whose tumours express PD-L1 with a tumour area positivity (TAP) score ≥ 5%
Marketing authorization holder in Denmark	BeOne Medicines Ireland Ltd 10 Earlsfort Terrace Dublin 02 T380 Ireland
ATC code	L01FF09
Combination therapy and/or co-medication	Tevimbra® (tislelizumab) in combination with platinum and fluoropyrimidine-based chemotherapy
Date of EC approval	27th of November 2024
Has the medicine received a conditional marketing authorization?	No
Accelerated assessment in the European Medicines Agency (EMA)	N/A
Orphan drug designation (include date)	N/A
Other therapeutic indications approved by EMA	**Non-small cell lung cancer (NSCLC)** *"Tevimbra® (tislelizumab) in combination with pemetrexed and platinum-containing chemotherapy is indicated for the first-line treatment of adult patients with non-squamous NSCLC whose tumours have PD-L1 expression on ≥50% of tumour cells with no EGFR or ALK positive mutations and who have:* • *locally advanced NSCLC and are not candidates for surgical resection or platinum-based chemoradiation, or* • *metastatic NSCLC."* *"Tevimbra® (tislelizumab) in combination with carboplatin and either paclitaxel or nab-paclitaxel is indicated for the first-line treatment of adult patients with squamous NSCLC who have:*

Overview of the medicine	
	• *locally advanced NSCLC and are not candidates for surgical resection or platinum-based chemoradiation, or* • *metastatic NSCLC."* *"Tevimbra® (tislelizumab) as monotherapy is indicated for the treatment of adult patients with locally advanced or metastatic NSCLC after prior platinum-based therapy. Patients with EGFR mutant or ALK positive NSCLC should also have received targeted therapies before receiving tislelizumab."* **Small cell lung cancer (SCLC)** *"Tevimbra® (tislelizumab), in combination with etoposide and platinum chemotherapy, is indicated for the first-line treatment of adult patients with extensive-stage SCLC."* **Oesophageal squamous cell carcinoma (OSCC)** *"Tevimbra® (tislelizumab), in combination with platinum-based chemotherapy, is indicated for the first-line treatment of adult patients with unresectable, locally advanced or metastatic OSCC whose tumours express PD-L1 with a TAP score ≥ 5%."* *"Tevimbra® (tislelizumab) as monotherapy is indicated for the treatment of adult patients with unresectable, locally advanced or metastatic OSCC after prior platinum-based chemotherapy."* **Nasopharyngeal carcinoma (NPC)** *"Tevimbra®, in combination with gemcitabine and cisplatin, is indicated for the first-line treatment of adult patients with recurrent, not amenable to curative surgery or radiotherapy, or metastatic NPC."*
Other indications that have been evaluated by the DMC (yes/no)	Tevimbra® have been recommended for OSCC by the DMC. Tevimbra for sqNSCLC is currently in the evaluation process.
Joint Nordic assessment (JNHB)	Are the current treatment practices similar across the Nordic countries (DK, FI, IS, NO, SE)? Not relevant. Is the product suitable for a joint Nordic assessment? No. If no, why not? A joint Nordic assessment is not relevant, as Tevimbra® (tislelizumab) has already been processed in other Nordic countries.
Dispensing group	BEGR
Packaging – types, sizes/number of units and concentrations	Tevimbra® (tislelizumab) is available as a 100 mg concentrate for solution for infusion. Each ml of the concentrate for solution for infusion contains 10 mg of tislelizumab. Each vial of 10 ml contains 100 mg of tislelizumab.

Source: [1–3].

2. Summary table

Summary	
Indication relevant for the assessment	Tevimbra®, in combination with platinum and fluoropyrimidine-based chemotherapy, is indicated for the first-line treatment of adult patients with HER-2-negative locally advanced unresectable or metastatic gastric or gastroesophageal junction (G/GEJ) adenocarcinoma whose tumours express PD-L1 with a tumour area positivity (TAP) score ≥ 5% [3].
Dosage regiment and administration	The recommended dose of Tevimbra® (tislelizumab) is 200 mg, administered by intravenous (IV) infusion once every 3 weeks (Q3W), in combination with chemotherapy. Patients should be treated with Tevimbra® (tislelizumab) until disease progression or unacceptable toxicity [3].
Choice of comparator	Nivolumab in combination with chemotherapy, as this is one of two equivalentcurrent possible standard treatments recommended by the Danish Medicines Council (DMC) [4].
Prognosis with current treatment (comparator)	No Danish data on the prognosis of patients with G/GEJ adenocarcinoma treated with nivolumab plus chemotherapy or pembrolizumab plus chemotherapy have been published since these treatments were recommended by the DMC in 2022 and 2024, respectively [4,5]. However, according to data from 2018-2022, the relative 1-year age-standardized survival rate for gastric cancer (GC) patients, expressed as percentage (95% CI), 59.8% (57.7-61.9) for men and 61.2% (58.3-64.3) for women, while the 5-year age-standardized relative survival rates, were 29.9% (27.7-32.3) for men and 37.3% (34.2-40.8) for women [6].
Type of evidence for the clinical evaluation	Network meta-analysis (NMA).
Most important efficacy endpoints (Difference/gain compared to comparator)	Overall Survival (OS), Progression-free survival (PFS), Grade ≥3 Treatment Related Adverse Event (TRAE), and health-related quality of life (HRQoL) between the intervention and comparator were compared in the NMA. From these endpoints, the NMA showed that tislelizumab combined with chemotherapy performed equally to nivolumab combined with chemotherapy [7]. The following results of each clinical trial were used in the NMA: **RATIONALE-305** Tislelizumab plus chemotherapy: • OS: 15.0 months • PFS: 6.9 months

Summary	
	Placebo plus chemotherapy: • OS: 12.9 months • PFS: 6.2 months **CheckMate 649** Nivolumab plus chemotherapy: • OS: 13.7 months • PFS: 7.7 months Chemotherapy: • OS: 11.6 months • PFS: 6.9 months Section 6, presents the available data from the clinical trials, including the data used in the NMA.
Most important serious adverse events for the intervention and comparator	The NMA showed no statistically significant difference between tislelizumab or nivolumab (all in combination with chemotherapy) when comparing Grade ≥3 TRAEs. Serious TRAEs with a frequency of ≥1% for tislelizumab plus chemotherapy at final analysis data-cutoff (DCO) February 2023) include: • Platelet count decreased n=16 (3.2%) • Vomiting n=6 (1.2%) Serious adverse event (SAEs) with a frequency of ≥1% were not reported in the publications for nivolumab plus chemotherapy.
Impact on health-related quality of life	Clinical documentation: **EuroQol visual analogue scale (EQ-VAS)**: Tislelizumab + chemotherapy led to a smaller decrease in health status according to the VAS score of the EQ-5D (EuroQol 5-dimensions) compared to placebo + chemotherapy. At cycle 6, the mean score change from baseline was 3.0 (SD): 16.38) for tislelizumab + chemotherapy and -0.8 (SD: 15.17) for placebo + chemotherapy. Health economic model: N/A
Type of economic analysis that is submitted	N/A
Data sources used to model the clinical effects	N/A

Summary	
Data sources used to model the health-related quality of life	N/A
Life years gained	N/A
QALYs gained	N/A
Incremental costs	N/A
ICER (DKK/QALY)	N/A
Uncertainty associated with the ICER estimate	N/A
Number of eligible patients in Denmark	N/A
Budget impact (in year 5)	N/A

3. The patient population, intervention, choice of comparator(s) and relevant outcomes

3.1 The medical condition

Disease description: Gastric cancer (GC) is the fifth most common cancer globally [8], with around 1.1 million new cases diagnosed in 2020 [9]. Gastric adenocarcinomas are classified into two subtypes based on their location. True gastric adenocarcinoma (G adenocarcinoma; also: non-cardia GC) arises in the lower portion of the stomach and gastroesophageal junction adenocarcinoma (GEJ; also: cardia GC) which arises in the region adjoining the oesophageal-gastric junction [10]. A decline in G adenocarcinoma has been observed over the past decades, while GEJ adenocarcinoma incidence is observed to increase [11,12]. HER-2 overexpression is observed in approximately 10-30% of all advanced G/GEJ adenocarcinomas [13].

Pathogenesis and risk factors: GC develops from chronic inflammation of epithelial cells, which progresses to atrophy, metaplasia, dysplasia, and eventually GC [14,15]. About 90-95% of GCs are adenocarcinoma (develops from gland cells) [16]. Around two-thirds of gastric adenocarcinoma arise from the lower portion of the stomach (G adenocarcinoma) and one-third in the GEJ (GEJ adenocarcinoma) [11,12]. More than 40% of patients with GC have tumors with PD-L1 expression [17]. PD-1 is an immune checkpoint protein expressed on T-cells that plays a pivotal role in monitoring immune responses [18,19]. Its

ligands, PD-L1 and PD-L2, are highly expressed in tumor cells, and the interaction with PD-1 induces an inhibitory signal that weakens T-cell activity, and therefore, allows the tumor cells to evade T-cell-mediated immune response. The etiology of GC is multifactorial and strongly depends on cancer subtype, ethnicity, geography and socioeconomic status. Chronic Helicobacter pylori (H. pylori) infection is considered the most common contributor to GC, with more than 60% of cases attributed to the bacterium [20]. G adenocarcinoma is associated with H. pylori in up to 90% of cases. GEJ adenocarcinoma is less commonly associated with H. pylori, with around 20% of cases attributed to the bacterium [21]. Other risk factors for GC include alcohol consumption, tobacco smoking, foods preserved by salting, low fruit intake, and high consumption of processed, grilled or barbecued meat [22–26]. Around 10%-20% of GCs are linked to germline genetic alterations [27,28].

Diagnosis: GC often remains unnoticed in the early stage due to lack of symptoms and is usually detected only in the advanced or metastatic stage [29]. The European Society for Medical Oncology (ESMO) Clinical Practice Guidelines for GC recommends endoscopic examination and foresees biopsies as the gold standard method for diagnosing GC. Diagnosis should be made from multiple (5-8) endoscopic biopsies to guarantee an adequate representation of the tumor. The diagnosis should be made from an endoscopic biopsy with histology classified according to the World Health Organization (WHO) criteria. HER-2 status and PD-L1 combined positive score (CPS) should be evaluated in patients with metastatic GC to tailor first-line (1L) treatment in combination with chemotherapy (CT) [30].

Clinical symptoms and quality of life

Common presenting signs and symptoms of GC are signs of advanced disease and include dysphagia, abdominal pain, melena, vomiting and weight loss [30,31]. Health-related quality of life (HRQoL) is negatively impacted by GC [32,33]. Clinical symptoms of G/GEJ adenocarcinoma are debilitating and significantly impair patient's quality of life (QoL), as reported in several clinical studies. A study by Xiao et al. 2023 reported lower HRQoL compared to the general population in patients from France, China, Germany, Japan, the UK, and the US with unresectable advanced or metastatic G adenocarcinoma (61%), GEJ adenocarcinoma (27%), or oesophageal cancer (12%), as measured with the EuroQoL-5 dimensions-3 level (EQ-5D-3L) [33]. A study using patients from two global, placebo-controlled, phase III randomized clinical trials (RCT)(N = 1,019, 77.7% had G adenocarcinoma and 22.3% had GEJ adenocarcinoma) reported patient QoL using the QoL questionnaire-core 30 questionnaire (QLQ-C30), and performance status at baseline and over the course of the study. At baseline, the highest impairments in QoL were reported for global QoL, fatigue, pain, and appetite loss, and scores did not differ among patients based on disease measurability [34].

Staging: Usually, the Tumour Node Metastases (TNM) system (8th edition, 2017) developed by the American Joint Committee on Cancer (AJCC)/Union for International Cancer Control (UICC) is used to stage GC. The current National Comprehensive Cancer Network (NCCN) Guidelines for GC and ESMO Clinical Practice Guidelines for GC use the AJCC/UICC TNM system (8th edition) to stage GC [30,35]. Early GC is confined to the mucosa or submucosa, with or without lymph node involvement (T1, any N) [36].

Advanced GC affects deeper layers (T2-T4). Regional lymph node involvement is described with N1-N3. Distant lymph node involvement is considered a metastasis (M1). M1 can be distant adenopathy, non-direct extension into other organs, or peritoneal carcinomatosis [37].

Prognosis: GC is the fifth leading cause of cancer deaths worldwide [8]. Mortality rates are high because most patients with GC present with advanced disease [16]. The 5-year relative survival rate for GC in Central Europe is 33% [38]. According to the AJCC, the stage of GC at the time of diagnosis is the most important predictive factor for the prognosis [39,40]. Early GC (adenocarcinoma that is confined to the mucosa or submucosa, with or without lymph node involvement) has a significantly better prognosis (approximately 90% five-year survival rate) than invasive gastric cancer (less than 10% five-year survival rate) [41,42].

3.2 Patient population

In Denmark, approximately 900 individuals are diagnosed with esophageal and stomach cancers each year, making them collectively the 8th most common type of cancer in the country, with a median age of 70 at diagnosis. The incidence of GEJ adenocarcinomas has increased in recent years, now surpassing both esophageal squamous cell carcinomas and gastric adenocarcinomas. In 2020, 1,119 new patients were registered with adenocarcinoma of the esophagus, GEJ, or stomach [43]. HER-2 overexpression is found in 10-30% of adenocarcinomas, indicating that 70-90% of G/GEJ adenocarcinoma patients are HER-2-negative [13]. There is no available database information on patient PD-L1 expression in Danish G/GEJ adenocarcinoma patients. However, the clinical study on which this application is based showed that 55% of patients in both arms had a PD-L1 tumour area positivity (TAP) score ≥ 5% [44]. In table 1 the incidence and prevalence of gastric and GEJ (G/GEJ) cancers in Denmark are presented. Incidence numbers refer to the Danish EsophagoGastric Cancer Group (DEGC) report from 2022 while prevalence numbers are based on numbers for GC in Denmark from NORDCAN [43,45]. NORDCAN does not provide insight into histologic subtypes of gastric cancer, nor provides numbers for GEJ cancer. The incidence and prevalence were validated by a Danish clinical expert.

Table 1. Incidence and prevalence from 2018 to 2022

Year	2018	2019	2020	2021	2022
Incidence in Denmark [46,47]	GEJ: 635 G: 236 Total: 871	GEJ: 626 G: 221 Total: 848	GEJ: 626 G: 227 Total: 853	GEJ: 674 G: 234 Total: 908	GEJ: 589 G: 272 Total: 861
Prevalence in Denmark (G) [45]	G: 2,278	G: 2,391	G: 2,556	G: 2,824	G: 2,909
Global prevalence	N/A	N/A	N/A	N/A	N/A

It is expected that patients with G/GEJ adenocarcinoma treated with nivolumab in combination with platinum- and fluoropyrimidine-based CT, or pembrolizumab in combination with platinum- and fluoropyrimidine-based CT, are eligible candidates for

treatment with tislelizumab in combination with platinum-based CT. In Denmark, this population includes patients with locally advanced, non-resectable, or metastatic HER-2-negative G/GEJ adenocarcinoma with high PD-L1 expression. In the Danish Medicines Council (DMC) assessment of pembrolizumab plus CT in this population, it was estimated that approximately 230 patients with PD-L1 CPS ≥5 would be eligible for treatment. This was estimated based on DEGC reports, an assumption that 80% of patients are HER-2-negative, and the KEYNOTE-859 study in which approx. 60% of patients had PD-L1 CPS ≥5. It is, however, highlighted that this estimate is associated with some uncertainty as there are no reports on Danish patients with recurrence receiving 1L treatment. The estimated number of patients eligible for treatment with tislelizumab plus CT is presented in Table 2 [4]. Furthermore, it is important to acknowledge that the scoring of PD-L1 expression differentiates between the indications for pembrolizumab and tislelizumab. While the indications for nivolumab and pembrolizumab both utilize CPS, the indication for tislelizumab employs TAP. Despite this difference, the analytical concordance and clinical utility between TAP and CPS scores are high [48–50]. Consequently, the estimated eligible population with CPS ≥5 is assumed to be approximately equivalent to that of the tislelizumab indication using the TAP score (TAP ≥5%). The concordance of the PD-L1 scoring methods is described in section 7.1.1.

Table 2. Estimated number of patients eligible for treatment

Year	Year 1	Year 2	Year 3	Year 4	Year 5
Number of new patients in Denmark who are eligible for treatment in the coming years	230	230	230	230	230

3.3 Current treatment options

In 2025, treatment guidelines for "*Onkologisk behandling af ikke-kurabel cancer i esophagus og ventrikel*" were published by DEGC. In these guidelines, the treatment recommendations for non-curable adenocarcinoma in PD-L1-positive patients are:

- Treatment with pembrolizumab + platinum- and fluoropyrimidine-based CT is recommended in 1L for patients in performance score (PS) 0-1 with HER-2-negative G/GEJ adenocarcinoma, and PD-L1 CPS ≥5 [43].
- Treatment with nivolumab + platinum- and fluoropyrimidine-based CT is recommended in 1L for patients in PS 0-1 with HER-2-negative esophageal or G/GEJ adenocarcinoma, and PD-L1 CPS ≥5 [43].
- Treatment with tislelizumab + platinum- and fluoropyrimidine-based CT is recommended in 1L for patients in PS 0-1 with HER-2-negative G/GEJ adenocarcinoma, and PD-L1 TAP score ≥5%. It should however be noted that this treatment has not been assessed by the DMC but is recommended by European Medicines Agency (EMA) [43].

Treatment with pembrolizumab in combination with platinum- and fluoropyrimidine-based CT is recommended by the DMC as 1L treatment for patients with locally

advanced, unresectable, or metastatic HER-2-negative G/GEJ adenocarcinoma, with PD-L1 CPS ≥5 [4]. Similarly, treatment with nivolumab in combination with platinum- and fluoropyrimidine-based CT is recommended by the DMC as 1L treatment for patients with unresectable advanced, recurrent, or metastatic G/GEJ adenocarcinoma and PD-L1 expression CPS ≥5 [5]. No Danish data on the prognosis of patients with G/GEJ adenocarcinoma treated with nivolumab plus CT or pembrolizumab plus chemotherapy have been published since the treatments were recommended by the DMC in 2022 and 2024, respectively [4,5]. However, according to data from 2018-2022, the relative 1-year age-standardized survival rate for GC patients, expressed as percentage (95% CI) was 59.8 (57.7-61.9) for men and 61.2 (58.3-64.3) for women, while the 5-year age-standardized relative survival rates, were 29.9 (27.7-32.3) for men and 37.3 (34.2-40.8) for women [6]. If patients with good general health were to experience disease progression during 1L treatment with nivolumab or pembrolizumab, other systemic treatment options are offered [43]:

- Irinotecan monotherapy
- Docetaxel or paclitaxel monotherapy

It is not expected that second-line (2L) treatment will change if tislelizumab were to be implemented as 1L treatment of patients with HER-2-negative G/GEJ adenocarcinoma with PD-L1 TAP score ≥5%.

3.4 The intervention

Table 3. Overview of the intervention

Overview of intervention	Tevimbra®
Indication relevant for the assessment	Tevimbra® (tislelizumab) is used in combination with platinum- and fluoropyrimidine-based chemotherapy, indicated for treatment of 1L treatment of adult patients with G/GEJ adenocarcinomas who are HER-2-negative locally advanced unresectable or metastatic and express PD-L1 with TAP score ≥ 5%.
ATMP	N/A
Method of administration	Tevimbra® (tislelizumab) is for IV use only.
Dosing	The recommended dose of tislelizumab is 200 mg administered by IV infusion, Q3W.
Dosing in the health economic model (including relative dose intensity)	N/A
Should the medicine be administered with other medicines?	Yes, in combination with platinum- and fluoropyromidine-based chemotherapies.
Treatment duration / criteria for end of treatment	Treatment until disease progression or unacceptable toxicity.

Overview of intervention	Tevimbra®
Necessary monitoring, both during administration and during the treatment period	Patients should be monitored for signs and symptoms of infusion-related reactions.
Need for diagnostics or other tests (e.g. companion diagnostics). How are these included in the model?	The assessment of PD-L1 expression confirmed by a validated test is required for tislelizumab and pembrolizumab, however, these tests are not included as this application does not include any model.
Package size(s)	Tevimbra® (tislelizumab) is available as 100 mg concentrate for solution for infusion. Each milliliter of the concentrate for solution for infusion contains 10 mg of tislelizumab. Tevimbra® (tislelizumab) is available in single packs containing one vial.

Sources: **[1,3]**.

3.4.1 Description of ATMP

N/A

3.4.2 The intervention in relation to Danish clinical practice

Tislelizumab plus CT is expected to be equivalent to nivolumab plus CT and pembrolizumab plus CT, offering another treatment option for patients with HER-2-negative locally advanced, unresectable, or metastatic G/GEJ adenocarcinoma with PD-L1 expression. PD-L1 is expressed using different types of scores. The indications of nivolumab and pembrolizumab use CPS while the indication of tislelizumab uses TAP. The Danish clinical guidelines state that all patients eligible for treatment should have PD-L1 expression determined using CPS. As such, TAP is currently not mentioned in the clinical guidelines [43]. TAP, Tumor Area Positivity, is defined by visually aggregating/estimating the area covered by PD-L1-positive tumor cells and tumor-associated immune cells relative to the total tumor area. The TAP and CPS equations are very similar, with two main differences: 1. the TAP numerator includes all immune cells, while the immune cells in the CPS numerator include only lymphocytes and, 2. the TAP denominator is a visual estimation of the tumor area, while the CPS denominator is based on cell counting. The TAP score is as effective as the CPS method in detecting patients with positive PD-L1 expression in tumor and immune cells, but substantially less time-consuming while retaining a high concordance rate with CPS [50]. The concordance of the PD-L1 scoring methods is further described in section 7.1.1.

3.5 Choice of comparator(s)

Both pembrolizumab plus CT and nivolumab plus CT are relevant comparators for tislelizumab plus CT in a Danish setting. These treatments are assessed as equivalent by the DMC [4]. However as this submission concerns the PD-L1 ≥5 population specifically, and as nivolumab plus CT and pembrolizumab plus CT has already been evaluated as

being equivalent, only nivolumab plus CT is included as a comparator as described in Section 6.1.1. This approach was approved by the DMC.

Table 4. Overview of comparator

Overview of comparator	Opdivo (nivolumab)
Generic name	Nivolumab
ATC code	L01FF01
Mechanism of action	Nivolumab is a human immunoglobulin G4 (IgG4) monoclonal antibody (HuMAb), that by binding blocks the PD-1 receptor's interaction with PD-L1 and PD-L2.
Method of administration	Administered every 2-4 weeks intravenously over 30 minutes in combination with chemotherapy. The infusion must be administered through a sterile, non-pyrogenic, low protein binding in-line filter with a pore size of 0.2-1.2 µm.
Dosing	Nivolumab: 240mg every two weeks or 480mg every four weeks per EMA indication. However, the DMC recommends weight-based dosing of 4,5 mg/kg every three weeks. Chemotherapy: the EMA SmPC do not specify the dosing of the concomitant therapy. However, according to DMC oxaliplatin and capecitabin are preferred as platinum- and fluoropyrimidine-based chemotherapies in Danish clinical practice. Oxaliplatin: 130 mg/m^2 IV day 1 every three weeks for up to 6 -9 cycles. Capecitabine: 2.000 mg/m^2 oral day 1 to 14 every three weeks for up to 9 series.
Dosing in the health economic model (including relative dose intensity)	N/A
Should the medicine be administered with other medicines?	Yes, in combination with platinum and fluoropyrimidine-based chemotherapy.
Treatment duration/ criteria for end of treatment	Treatment should be continued until disease progression or unacceptable toxicity in up until 24 months without disease progression.
Need for diagnostics or other tests (i.e. companion diagnostics)	The tumour expression of PD-L1 should be confirmed by a validated test.

Overview of comparator	Opdivo (nivolumab)
Package size(s)	Concentrate for solution for infusion - vials available as: - 40 mg/4 mL - 100 mg/10 mL - 120 mg/12 mL - 240 mg/24 mL

Source: [5,52].

3.6 Cost-effectiveness of the comparators

Both pembrolizumab plus CT and nivolumab plus CT have previously been evaluated by the DMC [4,5] and are assessed to be cost-effective. The DMC has assessed these to be equivalent and has recommended them as 1L treatment of HER-2-negative, locally advanced G/GEJ adenocarcinoma, and the DMC recommends the regions that use the combination with the lowest costs [4].

3.7 Relevant efficacy outcomes

3.7.1 Definition of efficacy outcomes included in the application

The DMC has previously deemed the following outcome measures clinically relevant for patients with HER-2-negative, locally advanced G/GEJ adenocarcinoma: OS, PFS, HRQoL, and safety [4,5]. As such, the relevant outcomes to assess the efficacy of tislelizumab compared to nivolumab and pembrolizumab are OS, PFS, Grade ≥3 TRAEs and HRQoL. The efficacy outcomes deemed relevant for this submission are presented in Table 5.

Table 5. Efficacy outcome measures relevant for the application

Outcome measure	Time point	Definition	How was the measure investigated/method of data collection
OS RATIONALE-305 [44,53] Checkmate 649 [54,55]	**RATIONALE-305:** Median (range) time on follow-up was 11.8 (0.1-33.4) months in PD-L1-positive group and 13.2 (0.1-50.1) months on ITT analysis set. **Checkmate 649:** Up to 17 approximately months up to 42 months.	**RATIONALE-305:** OS was defined as the time from the date of randomization to the date of death due to any cause. **Checkmate 649**: OS was defined as the time from randomization to the time of death, in participants treated with either treatment drug	**RATIONALE-305: N/R** **Checkmate 649: N/R**

Outcome measure	Time point	Definition	How was the measure investigated/method of data collection
PFS RATIONALE-305 [44,53] Checkmate 649 [54,55]	**RATIONALE-305:** Until study completion up to 54 months. Median (range) time on follow-up was 13.2 (0.1-50.1) in PD-L1-positive group and was 13.2 (0.1-50.1) in ITT analysis set. **Checkmate 649:** PFS was assessed every 6 weeks up to 36 months.	**RATIONALE-305:** PFS was defined as the time from the date of randomization to the date of the first objectively documented tumor progression assessed by the investigator according to RECIST v1.1, or death, whichever occurred first. **Checkmate 649:** PFS was defined as the time from randomization to the date of first documented progression or death due to any cause.	**RATIONALE-305:** Assessed by investigator per RECIST v1.1 **Checkmate 649:** Assessed by BICR per RECIST v1.1
HRQoL RATIONALE-305 [44,53] Checkmate 649 [54,55,62]	**RATIONALE-305:** From baseline and at cycles 4 and 6. **Checkmate 649:** At baseline and every 6 weeks, at follow-up visit 1 and 2, and every 3 months thereafter at survival follow-up visits.	**RATIONALE-305:** HRQoL assessment of participant's overall health status. **Checkmate 649:** HRQoL assessment of the impact of treatment on the general health status of patients and impact of treatment on cancer-related QoL.	**RATIONALE-305:** EORTC-QLQ-30, EORTC-QLQ-STO22 and EQ-V**AS**. **Checkmate 649:** EQ-V**AS, EQ-5D-3L** and FACT-Ga.
Grade ≥3 TRAEs RATIONALE-305 [44,53] Checkmate 649 [54,55]	**RATIONALE-305:** From first dose of study drug to 30 days after last dose or the initiation of new oncologic treatment, whichever occurred first, up to the end of study. **Checkmate 649:** Duration of treatment was 6.8 (0.1-57.7) months for intervention	**RATIONALE-305:** Included TRAEs of grade ≥ 3 that were considered by the investigator to be related to the study drug or TRAEs with missing causality **Checkmate 649:** Safety was assessed by occurrence of TRAEs.	**RATIONALE-305:** Assessed by investigator per NCI CTCAE v5.0 **Checkmate 649:** Assessed by investigator per NCI CTCAE v4.0 and Medical Dictionary for Regulatory Activities v25.0.

Outcome measure	Time point	Definition	How was the measure investigated/method of data collection
	group and 4.9 (0.0-55.2) for placebo group.		

Validity of outcomes

As described above, all outcomes included in this submission (OS, PFS, safety and HRQoL) were deemed clinically relevant by the DMC in previous assessments of pembrolizumab and nivolumab [4,5]. PFS was assessed by Response evaluation criteria in solid tumours version 1.1 (RECIST v1.1), a guideline which is commonly used and highly acknowledged [64]. Safety was assessed using National cancer institute common terminology criteria for adverse events, version 5.0 (NCI CTCAE v5.0). HRQoL was measured using different tools including EORTC-QLQ-30, EORTC-QLQ-STO22, and EQ-5D-5L. This submission will focus on EORTC-QLQ-30, EORTC-QLQ-STO22, and EQ-5D-5L data, as the Network meta-analysis (NMA) includes comparison of EORTC-QLQ-30 and EORTC-QLQ-STO22 data between studies, while EQ-5D-5L is preferred by the DMC [65].

5. Overview of literature

5.1 Literature used for the clinical assessment

A systematic literature review (SLR) was conducted on February 16th, 2024. Using the Ovid® search interface, the following electronic databases were searched: Embase, Ovid medical literature analysis and retrieval system online (MEDLINE®) (including Epub Ahead of Print and In-Process & other non-indexed citations), Ovid MEDLINE® Daily, Cochrane central register of controlled trials (CCRCT), and the Cochrane database of systematic reviews (CDSR). Additional searches of grey literature sources were conducted to maximize the inclusion of all relevant studies. The SLR was updated on September 4th, 2024. In total, the original and updated SLR identified 43 unique RCTs of which 5 were relevant to the Danish setting. The 5 relevant RCTs are presented in Table 7. The original and updated SLRs are described in detail in Appendix H.

6. Efficacy

6.1 Efficacy of tislelizumab plus chemotherapy compared to nivolumab plus chemotherapy and pembrolizumab plus chemotherapy for 1L treatment of adult patients with HER-2-negative locally advanced unresectable or metastatic G/GEJ adenocarcinoma whose tumours express PD-L1 with a TAP score ≥ 5%

6.1.1 Relevant studies

For efficacy analysis in this submission, the population of interest was PD-L1 expression ≥5 (TAP/CPS) populations in the relevant studies RATIONALE-305 and CheckMate 649. All studies reporting on the efficacy of pembrolizumab were excluded from the analysis and application, as nivolumab studies were deemed sufficient for estimating the comparative efficacy of tislelizumab, as agreed upon with the DMC. The studies KEYNOTE-859 and KEYNOTE-062 reported on efficacy of pembrolizumab, and will not be discussed further. The ATTRACTION 4 Part 2 study did not report results for PD-L1 ≥5 populations and was therefore also excluded from the efficacy comparison. Pre-specified subgroup analyses for Rest of the World (ROW) (non-Asia) and ROW (non-Asia) with PD-L1 expression ≥5 subpopulations in RATIONALE-305 and CheckMate 649 are presented in Appendix L.

Table 10. Overview of study design for studies included in the comparison

Trial name, NCT-number (reference)	Study design	Study duration	Patient population	Intervention	Comparator	Outcomes and follow-up time
RATIONALE-305 NCT03777657 [44,53]	Global, randomized (1:1), double-blind, placebo-controlled, phase III study that assessed the efficacy and safety of 1L treatment with either tislelizumab plus standard ICC doublet or placebo plus ICC doublet	The trial was initiated on December 13, 2018, with final analysis (DCO February 28, 2023), and close-out analysis (DCO September 20, 2024).	Patients aged 18 years or older with HER-2-negative, locally advanced, unresectable or metastatic G/GEJ adenocarcinoma, regardless of PD-L1 status, who have not received prior systemic anticancer therapy for advanced disease.	**Initial cycles up to 6 treatment cycles:** Tislelizumab 200mg IV, Day 1, Q3W + ICC doublet. Doublet A: Oxaliplatin 130mg/m^2 IV, Day 1 + Capecitabine 1000 mg/m^2 orally b.i.d. for consecutive 14 days, repeated Q3W. Doublet B: Cisplatin 80 mg/m^2 IV, Day 1 + 5-FU 800 mg/m^2/day IV continuous infusion over 24 hours daily on Day 1-5, repeated Q3W. **Cycle 7 and beyond:**	Initial cycles up to 6 treatment cycles: Placebo + CT with ICC doublet. Doublet A: As described in intervention. Doublet B: As described in intervention. Cycle 7 and beyond: Placebo + Capecitabine 1000mg/m^2 orally b.i.d. for consecutive 14 days, repeat Q3W.	**Primary Outcomes:** OS in the PD-L1-positive and ITT analysis set defined as the time from the date of randomization to the date of death due to any cause (Time frame: up to 43 months). **Secondary Outcomes:** PFS in the PD-L1-positive and ITT analysis set assessed by investigators defined as the time from the date of randomization to the date of the first objectively documented tumour progression, assessed by investigators per RECIST v1.1, or death, whichever occurs first (Time frame: up to 27 months.) HRQoL assessed change from baseline in EORTC QLQ-STO22, EORTC QLQ-C30, and EQ-5D-5L scores (Time frame: up to 43 months). Safety and tolerability assessed based on the incidence and severity of AEs per NCI CTCAE v5.0 (Time frame: up to 43 months).

Trial name, NCT-number (reference)	Study design	Study duration	Patient population	Intervention	Comparator	Outcomes and follow-up time
				Tislelizumab 200mg IV Day 1 Q3W + capecitabine 1000mg/m^2 orally b.i.d. for consecutive 14 days repeated Q3W.		
CheckMate 649 NCT02872116 [54,55,67]	Randomized, open-label, multicenter, phase III trial that assessed the efficacy and safety of 1L treatment with nivolumab-plus-CT, nivolumab-plus-ipilimumab (not relevant for this submission), or CT.	The trial was initiated on October 12, 2016, with study completion on June 6, 2024.	Adults with previously untreated, unresectable, advanced, or metastatic GC/GEJC/EAC were enrolled, regardless of PD-L1 expression. HER-2-positive patients were excluded.	Nivolumab (360 mg Q3W or 240 mg every 2 weeks) + ICC. XELOX: capecitabine 1000 mg/m^2 b.i.d., days 1–14 and oxaliplatin 130 mg/m^2, day 1, Q3W. FOLFOX: leucovorin 400 mg/m^2, day 1, fluorouracil 400 mg/m^2, day 1 and 1200 mg/m^2, days 1–	ICC alone. XELOX: capecitabine 1000 mg/m^2 b.i.d., days 1–14 and oxaliplatin 130 mg/m^2, day 1, Q3W. FOLFOX: leucovorin 400 mg/m^2, day 1, fluorouracil 400 mg/m^2, day 1 and 1200 mg/m^2, days 1–2, and oxaliplatin 85 mg/m^2, day 1, every 2 weeks.	**Primary Outcomes:** OS by BICR per RECIST v1.1, evaluated in patients with PD-L1 CPS ≥5, defined as time from randomization to death (Time frame: From the date of randomization up to the date of death, up to approximately 17 month). PFS by BICR per RECIST v1.1, evaluated in patients with PD-L1 CPS ≥5, defined as time from randomization to the date of first documented tumour progression or death (Time frame: From randomization to the date of the first documented PD per BICR or death due to any cause (up to approximately 10 months)). **Secondary Outcomes:** OS in patients with PD-L1 CPS ≥1 and all randomized patients (Time frame: From the date of randomization up to the date of death, up to approximately 17 month).

Trial name, NCT-number (reference)	Study design	Study duration	Patient population	Intervention	Comparator	Outcomes and follow-up time
				2, and oxaliplatin 85 mg/m^2, day 1, every 2 weeks.		BICR-assessed PFS at different PD-L1 CPS cutoffs and in all randomized patients (Time frame: From randomization to the date of the first documented PD per BICR or death due to any cause (up to approximately 10 months)). HRQoL assessed by FACT-Ga (Time frame: From randomization to a clinically meaningful decline from baseline in GaCS score). Safety through incidence of TRAEs (Time frame: throughout treatment period and during follow-up).

6.1.2 Comparability of studies

Both trials were randomized, controlled, multicenter, phase III trials. RATIONALE-305, was a double-blind trial, while CheckMate 649 was open-label. Both trials included an immunotherapy treatment arm paired with CT. RATIONALE-305 included a placebo plus a CT arm, while CheckMate 649 included a CT-only arm. CT regimens varied across the trials, with differences noted in dose and dosing schedule. Crossover was not permitted in RATIONALE-305, while the other CheckMate 649 did not report whether crossover was allowed. The follow-up time for OS and PFS varied between studies, ranging from 34.25 months to 49.5 months for OS [44,67,69]. Despite minor differences in trial characteristics noted above, such as blinding, follow-up time, and reporting of crossover, the assessed trials were deemed sufficiently similar to derive reasonable estimates of comparative efficacy via an indirect treatment comparison (ITC), such as an NMA.

6.1.2.1 Comparability of patients across studies

Baseline characteristics for the PD-L1 ≥5 (CPS/TAP) populations in the RATIONALE-305 and CheckMate 649 trials are presented in Table 11. Baseline characteristics for the ITT population are presented in Appendix K.

Table 11. Baseline characteristics of patients in studies included for the comparative analysis of efficacy and safety, PD-L1 ≥5 population

*Defined as non-Asian **United States and Canada. †Rest of the world. ‡Western Europe, Israel, North America and Australia.

Patient eligibility criteria: Patient eligibility was similar in most respects. Both trials included adult patients with confirmed unresectable, locally advanced, or metastatic G/GEJ adenocarcinoma for 1L treatment, however, CheckMate 649 also included patients with esophageal adenocarcinoma in addition to GC/GEJ patients. Efficacy outcomes and baseline characteristics were reported for all randomized patients and PD-L1 subtypes in both studies. Exclusion criteria varied minimally between trials [44,54].

Baseline characteristics: Age and sex data were similar across trials included. Variation was observed in the proportion of Asian participants by geography. Both trials included patients based in Asia and provided data for both Asian and non-Asian subgroups as well as non-Asian patients with PD-L1 ≥5%. The proportion of Asian patients ranged from 24.5% to 73.9%. Metastatic disease at entry was also similar across trials ranging from 95% to 99% in the ITT population. There was a variation between studies in type of PD-L1 measurement and cut-offs (≥1%, ≥5%, or ≥10%) [44,54].

Type of PD-L1 measure: The threshold and method of reporting PD-1/PD-L1 status varied across trials. In CheckMate 649, PD-L1 was assessed by CPS [54]. RATIONALE-305 used TAP to assess PD-1/PD-L1 expression [44].

Table 12. Overview of PD-L1 expression thresholds and measurements

	RATIONALE-305 [44]	CheckMate 649 [54]
Type of PD-L1 measurement	TAP	CPS

Primary trial PD-L1 cut-off	PD-L1 TAP ≥5%	CPS PD-L1 ≥1%, ≥5%, and ≥10%

6.1.3 Comparability of the study population(s) with Danish patients eligible for treatment

In 2022, the mean age in the Danish population was 72 years for both GEJ adenocarcinomas (range: 31–102) and gastric adenocarcinomas (range: 31–93), while the mean age in RATIONALE-305 was 59.3 years (range: 23.0–86.0). The proportion of male patients was 80.3% for GEJ adenocarcinomas and 59.2% for gastric adenocarcinomas in Denmark, compared to 69.4% in the RATIONALE-305 study population [44,46]. When comparing the study population of RATIONALE-305 with the Danish patient population, a difference is seen in ethnic distribution evaluated by geographical region. A Danish clinical expert has evaluated this difference and concludes that the ethnic difference is not expected to substantially influence the efficacy and safety in the Danish population compared to the population of RATIONALE-305. This conclusion is further supported by results presented in Appendix L.

Table 13. Characteristics in the relevant Danish population and in the health economic model

N/A		

6.1.4 Efficacy – results per RATIONALE-305

RATIONALE-305 was a randomized, double blind, global, phase III clinical trial that assessed the efficacy and safety of 1L treatment with either tislelizumab plus standard ICC doublet or placebo plus ICC doublet for advanced G/GEJ adenocarcinoma [44]. The DCO from February 28, 2023, constitutes the final analysis. Additionally, there was a DCO for an interim analysis on October 8, 2021, and the DCO for the close-out analysis was September 20, 2024. This section will include results from the final analysis (DCO February 28, 2023) and the close-out analysis (DCO September 20, 2024) [7,44]. Data retrieved from the ITT analysis set and the PD-L1-positive analysis set will be presented in the following. Additionally, data from the ITT population and European and North American subpopulation will be presented in Appendix A and Appendix L, respectively.

6.1.4.1 Final Analysis (DCO February 2023)

Minimum study follow-up time (defined as time from the date of the last patient randomized to the DCO) was 24.6 months at the final analysis (DCO February 2023). Median study follow-up duration (defined as time from randomization to DCO, death, or study discontinuation owing to other reasons, whichever came first for all patients) was 13.2 (IQR 7.1-24.6) months at the final analysis. The median duration of exposure to CT was 5.9 (IQR 3.3-11.9) months for tislelizumab (TIS) + CT and 5.7 (IQR 3.0-9.8) months for placebo (PBO) + CT; the median durations of exposure were similar between the two arms [44].

6.1.4.1.1 Overall survival

PD-L1 TAP ≥5% population: In the final analysis, the median OS was 16.4 months [95% CI: 13.6 to 19.1] for TIS + CT versus 12.8 months [95% CI: 12.0 to 14.5] for PBO + CT. In the PD-L1 TAP ≥5% population Cox regression models for both OS and PFS were stratified by region (East Asia versus Europe/North America) and presence of peritoneal metastasis. The stratified HR for mortality was 0.71 [95% CI: 0.58 to 0.86; P = 0.006] for TIS + CT. The TIS + CT arm led to a higher OS rate than the PBO + CT arm, indicating a sustained OS benefit of treatment with TIS + CT in patients with a PD-L1 TAP score ≥5%, as compared to PBO + CT [44]. The median follow-up times by reverse Kaplan-Meier methodology were 32.5 months [95% CI: 30.2 to 35.9] and 32.2 months [95% CI: 29.9 to 34.6] for the TIS + CT arm and the PBO + CT arm, respectively [7]. The Kaplan-Meier plot is presented in Appendix B.

6.1.4.1.2 Progression-free survival

PD-L1 TAP ≥5% population: As of the DCO date February 28, 2023, 162 (59.1%) patients progressed in the TIS + CT arm and 195 (71.7%) in the PBO + CT arm. The median PFS of TIS + CT was 7.2 months [95% CI: 5.8 to 8.4] and 5.9 months [95% CI: 5.6 to 7.0] for the PBO + CT arm (stratified HR = 0.68 [95% CI: 0.56 to 0.83]). The Kaplan-Meier curves began to separate at approximately 9 months in favor of TIS + CT [44], as presented in Appendix B.

6.1.4.2 Close-out data (DCO August 2024)

6.1.4.2.1 Overall survival

PD-L1 TAP ≥5% population: The improvements in OS for TIS + CT versus PBO + CT in patients with a PD-L1 score ≥ 5% were consistent with those reported in the final analysis. Results are presented in Table 14.

Table 14. Overall survival in the PD-L1 TAP ≥5% population (RATIONALE-305, DCO August 2024)

Median follow-up time, months (95% CI)	[redacted]	[redacted]

[redacted]

Source: All data in the table above has been sourced from an internal CSR[7].

6.1.4.2.2 Progression-free survival

At DCO August 2024, with an additional 18 months of follow-up after final analyses, TIS + CT continued to demonstrate clinical benefits observed across all secondary endpoints in

both the ITT population and the PD-L1 TAP ≥5% population. Results were consistent with those reported in the final analysis. The median PFS associated with TIS + CT was significantly better than with PBO + CT [redacted] and [redacted] respectively; stratified HR = [redacted]]), as seen in the internal, confidential EVD for RATIONALE-305 [7].

6.1.5 Efficacy – results per CheckMate 649

At DCO 27 May, 2021, NIV + CT demonstrated improved OS versus CT in patients with PD-L1 CPS ≥5; median OS was 14.4 months (95% CI: 13.1-16.2) versus 11.1 months (95% CI: 10.0-12.1), respectively. There was a 30% reduction in the risk of death (HR 0.70, 95% CI: 0.61-0.81). A PFS benefit was observed with NIV + CT versus CT in patients with PD-L1 CPS ≥5 (HR 0.70, 95% CI: 0.60–0.81). At 3-year follow-up, with 36.2 months minimum follow-up, for patients with PD-L1 CPS ≥5, the OS HR for NIV + CT versus CT was 0.70 (95% CI: 0.61 to 0.81); 21% versus 10% of patients were alive at 36 months, respectively; the PFS HR was 0.70 (95% CI: 0.60 to 0.81). [54]. At the 48 months minimum follow-up, NIV + CT continued to demonstrate OS and PFS benefit vs CT in patients with PD-L1 CPS ≥5 [67]. Results for the 48-month follow-up are presented in Table 15. No Kaplan-Meier data is available from the 48-month follow-up, hence Kaplan-Meier data for OS and PFS from the 3-year follow-up are presented in Figure 1 and Figure 2.

Table 15. 48-month follow-up results - CheckMate 649

	PD-L1 CPS ≥5	
	NIV + CT (n = 473)	CT (n = 482)
Median OS, months (95% CI)	14.4 (13.1–16.2)	11.1 (10.1–12.1)
HR (95% CI)	0.70 (0.61–0.81)	
48-month OS rate, % (95% CI)	17 (14–21)	8 (6–11)
Median PFS[a], months (95% CI)	8.3 (7.0–9.3)	6.1 (5.6–6.9)
HR (95% CI)	0.71 (0.61–0.82)

7. Comparative analyses of efficacy

7.1.1 Differences in definitions of outcomes between studies

The outcomes used in this NMA are OS, PFS, and TRAE ≥ Grade 3. OS and PFS were reported in both trials identified in the SLR. For safety results, see section 9. The definition of OS was aligned across trials, where OS was defined as the time from randomization to death due to any cause. Of note, CheckMate 649 did not explicitly mention that death was from "any cause"; however, it was assumed that the definition of OS was equivalent to that of RATIONALE-305. The definition of PFS was similar across the trials, where PFS was defined as the time from randomization to disease progression or death, whichever occurred first. In RATIONALE-305, PFS was assessed via BICR per RECIST v1.1. In CheckMate 649, PFS was assessed by the investigator and a central review committee per RECIST v1.1 [44,69]. Hereby, the trials were considered sufficiently similar to obtain reasonable indirect estimates of efficacy.

PD-L1 measurement types: As previously mentioned in sections 3.2 and 3.4.2, a distinction exists between the trials concerning the type of measurement utilized to

report PD-L1 expression. In RATIONALE-305, PD-L1 status was measured in patients using the TAP score, additionally, exploratory biomarker analysis was performed to analyze the CPS score [44,71]. In the study and analysis conducted by Qiu et al. (2024) [44] and Moehler et al. (2024) [71], the concordance between TAP and CPS was examined for RATIONALE-305. Qiu et al. (2024) found a concordance between TAP scores of ≥5% and CPS of ≥5 in their exploratory biomarker analysis. The PD-L1 status by CPS and TAP in all randomized patients are presented in Table 16 [44]. These findings were corroborated by Moehler et al. (2024) and Liu et al. (2023) [50,71]. Moehler et al. (2024) reported substantial concordance in terms of overall percentage agreement (82%, 95% CI: 80-85) and Cohen's Kappa (0.64, 95% CI: 0.60-0.69) [71]. The study by Liu et al. (2023) concluded that the TAP scoring method is straightforward, significantly less time-consuming, and highly reproducible with a high concordance rate between TAP score and CPS [50].

Table 16. PD-L1 expression status by CPS and TAP score in all randomized patients in RATIONALE-305

Subgroup	TIS + CT arm (n=501)	PBO + CT arm (n=496)	Total (N=997)
PD-L1 status by CPS*†			
CPS ≥5	254 (51)	269 (54)	523 (54)
CPS <5	237 (47)	214 (43)	451 (45)
CPS unevaluable	10 (2)	13 (3)	23 (3)
PD-L1 status by TAP score			
TAP ≥5%	274 (55)	272 (55)	546 (55)
TAP <5%	227 (45)	224 (45)	451 (45)

Data are n (%). *PD-L1 CPS was assessed *post hoc* using the same slide the prespecified TAP score was assessed with (stained with the VENTANA PD-L1 (SP263) platform). †23 samples with evaluable TAP score were found not evaluable for CPS scoring mainly because of insufficient tumour cells, tissue fall off, and staining fading. Source: **[72]**.

The results presented in Table 16 indicate that the proportion of patients with TAP ≥5% is similar to the proportion of patients with CPS ≥5. As such, it is assumed that there is great overlap between patients with TAP ≥5% and CPS ≥5. Moreover, the analysis by Moehler et al. (2024) showed similar OS HRs. OS unstratified HR (95% CI) for TAP ≥5% and CPS ≥5 was 0.72 (0.59-0.88) and 0.73 (0.60-0.89), respectively [71]. These consistent TAP and CPS results indicate that both methods are suitable for clinical PD-L1 expression measurement in patients with G/GEJ adenocarcinoma. This is further supported by a recent study by Klempner et al. (2024) which measured an intraclass correlation coefficient ≥0.92, independently of the PD-L1 cut-off, and found substantial agreement in the PD-L1 expression ≥ 5 group in GC patients [49]. Based on clinical experience and the concordance studies presented in this section, the Danish clinical expert agreed that the TAP and CPS scoring methods are comparable and can be used interchangeably.

7.1.2 Method of synthesis

An NMA was conducted for the comparison of TIS + CT, PEM + CT, and NIV + CT. This section will briefly describe the choice of methods, methodology, and feasibility assessment. The trials included in the NMA (RATIONALE-305, ATTRACTION-4 Part 2, KEYNOTE-062, KEYNOTE-859, and CheckMate 649) were identified through the SLR presented in Section 5.1. The NMA is based on latest available data from the 5 clinical trials, including RATIONALE-305 DCO August 2024 [44], ATTRACTION-4 Part 2 DCO May 2021 [60], CheckMate 649 4-year follow-up [69], KEYNOTE-062 DCO 19 April 2021 [68], and KEYNOTE-859 DCO 3 October 2022 [59]. Trial design characteristics, patient eligibility criteria, baseline patient characteristics, and outcome characteristics were all sources of clinical heterogeneity explored in the feasibility assessment. Network connectivity for NMAs and anchored comparisons (i.e., the presence of a common comparator) were also assessed. A visual representation of the evidence network for all outcomes is provided in Figure 3. The common comparator to all trials is PBO plus CT [7]. As previously described only RATIONALE-305 and CheckMate 649 are relevant for this submission and therefore only results and feasibility assessments for TIS + CT (RATIONALE-305) and NIV + CT (CheckMate 649) will be presented in the following sections.

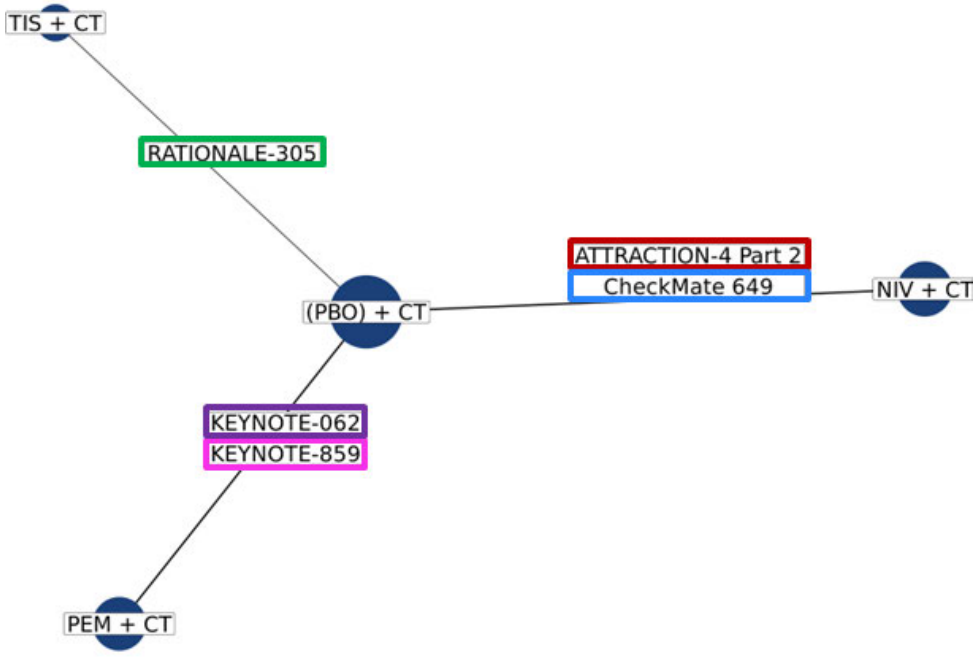

Figure 3. Evidence network for all outcomes
Source: [7].

Outcomes of interest for the feasibility assessment were OS, PFS, and safety outcome Grade ≥3 TRAEs. These were selected based on the key outcomes evaluated in the RATIONALE-305 trial. Following the qualitative assessment of heterogeneity and clinical opinion, it was considered feasible to conduct ITCs between the RATIONALE-305 trial and CheckMate 649. The recommended ITC was an NMA, as (a) the trials were sufficiently similar to be compared without requiring population-level adjustment, (b) there is precedent for conducting NMAs in this patient population, (c) the differences observed

between patient populations could be assessed via subgroup analyses, (d) NMAs allow for comparisons among all relevant treatments in a single analysis, and finally, (e) NMAs are reproducible and accepted by most Health technology assessment (HTA) bodies. NMAs were feasible for the following outcomes: OS, PFS, and grade ≥3 TRAEs. The NMAs were feasible for these outcomes under the assumption that all CT backbone treatments are comparable and can be pooled into a single node. NMAs were conducted for each of the outcomes using a Bayesian framework. Analyses were conducted using ITT populations for each trial, and subgroups analyses were conducted for patients with PD-L1 ≥5% (TAP ≥5% or CPS ≥5) status, and for OS in non-Asian patients with PD-L1 ≥5% (TAP ≥5% or CPS ≥5). For time-to-event outcomes (OS and PFS), fixed-effect contrast-based normal models with vague priors were used, transforming HRs and 95% CIs for analysis. Binomial outcomes (TRAEs) were analyzed using fixed-effect arm-based binomial models, where treatment effects were estimated on the log-odds scale and then transformed back to odds ratios (ORs) and 95% CIs for presentation. For continuous outcomes (HRQoL), fixed-effect contrast-based normal models were used, presenting the mean difference and 95% CIs between treatments. KM curves, estimated median survival, and estimated survival rates are not presented, as these have not been calculated in the NMA [7]. Proportional hazards (PH) assumption for OS and PFS between PD-L1 inhibitors included in the base case analysis was assessed via visual inspection of log-cumulative hazard plots, visual inspection of Schoenfeld residuals plots, and performance of the Grambsch-Therneau test. When considering data from the final DCO for RATIONALE-305, there were no clear violations of the PH assumption for OS among PD-L1 inhibitors. There were also no clear violations of the PH assumption for PFS among PD-L1 inhibitors, except in comparisons involving NIV + CT, where p-values for the Grambsch-Therneau test were <0.05 and patterns suggestive of violation were observed in the Schoenfeld residual plots. This indicates that the HR might not represent the true proportionality of hazard rates across time for PFS between the two treatments. Cumulative hazard log plots and Schoenfeld residual plots with Grambsch-Therneau p-values for OS are presented in Figure 8 and Figure 9, respectively, and for PFS in Figure 10 and Figure 11, respectively. As presented in Section 6.1.4, results for OS and PFS from the RATIONALE-305 close-out DCO are consistent with results from the final DCO. Thus, it was assumed that PH assumptions would not change between the primary and close-out DCOs, and the PH assumptions were not evaluated again for the ITT population based on the close-out DCO [7]. PH assumptions for OS and PFS between treatments were assessed between TIS + CT (RATIONALE-305) vs. NIV + CT (CheckMate 649) in the PD-L1 ≥5% subgroup. When considering data from the close-out DCO for RATIONALE-305, there was no evidence of PH violation (i.e., p-value > 0.05 and parallel series on the log-cumulative hazard plots). For PFS, there was some evidence of PH violation based on the p-value (<0.05) and crossing-over in the log-cumulative hazard plot, and thus, the PFS comparative results of TIS + CT vs. NIV + CT in this subgroup should be interpreted with caution. Cumulative hazard log plots and Schoenfeld residual plots with Grambsch-Therneau p values for OS are presented in Figure 12 and Figure 13, respectively, and for PFS in Figure 14 and Figure 15, respectively [7].

7.1.3 Results from the comparative analysis

ITT population: Results of the NMA are presented in Table 17 for the ITT population. As PEM + CT and NIV + CT were previously deemed equivalent by the DMC, results of the comparison of these are not presented in this submission [4]. Absolute results, estimated median survival, and survival rates were not calculated in the NMA. Therefore, these are not presented here.

Table 17. Results from the comparative analysis of TIS + CT vs. NIV + CT for ITT

Outcome measure	TIS + CT (N=501)	NIV + CT (N=1151)	Result
OS	[redacted]	[redacted]	[redacted]
PFS	[redacted]	[redacted]	[redacted]

Note: HR > 1 indicates TIS + CT has greater hazard than the comparator therapy. HR < 1 indicates TIS + CT has a lesser hazard than the comparator therapy. Bold font indicates statistical significance at the 0.05 level. All table data has been sourced from an internal NMA report [7].

PD-L1 ≥5 subgroup analysis: To support the indication of tislelizumab, subgroup analyses based on PD-L1 status were conducted for a cutoff of PD-L1 5% (TAP ≥5% or CPS ≥5). Based on concordance studies of TAP and CPS described in Section 7.1.1, it was assumed that TAP ≥5% was equivalent to CPS ≥5 [44,49,71]. Where more than one measure of PD-L1 was provided by a trial, the order of preference for selecting a measure for analysis was TAP > CPS, based on TAP as the primary PD-L1 measurement for the RATIONALE-305 trial. The results of the PD-L1 ≥5% subgroup analyses for OS and PFS are presented in Table 18 [7].

Table 18. Results from the comparative analysis of TIS + CT vs NIV + CT for PD-L1 ≥5%

Outcome measure	TIS + CT (N=274)	NIV + CT (N=473)	Result
OS	[redacted]	[redacted]	[redacted]
PFS	[redacted]	[redacted]	[redacted]

*Only utilized data from one of the listed comparator trials due to lack of data. This may account for differences in results. Note: HR > 1 indicates TIS + CT has greater hazard than the comparator therapy. HR < 1 indicates TIS + CT has a lesser hazard than the comparator therapy. Bold font indicates statistical significance at the 0.05 level. All table data has been sourced from an internal NMA report [7].

7.1.4 Efficacy – results per OS

ITT population: TIS + CT performed similarly to NIV + CT ([redacted]). No statistically significant differences were observed between active treatments. Surface Area Under the Cumulative Ranking Curve (SUCRA) values and probability best values are presented in Table 19. Aligned with the league table, TIS + CT was associated with a SUCRA value of [redacted] [7].

Table 19. Summary of SUCRA values from the fixed-effects NMA for OS in ITT

Treatment Arm	SUCRA (%)	Probability Best (%)
TIS + CT	[redacted]	[redacted]
NIV + CT	[redacted]	[redacted]

Source: All table data has been sourced from an internal NMA report [7].

PD-L1 ≥5% subgroup: TIS + CT performed similarly to NIV + CT ([redacted]) in the PD-L1 ≥5% subgroup. No statistically significant differences were observed between active treatments. SUCRA values and probability best values are presented in Table 20. Aligned with the league table, TIS + CT was associated with a SUCRA value of [redacted] [7].

9. Safety

9.1 Safety data from the clinical documentation

In RATIONALE-305, safety was assessed in the safety population, defined as all patients who received at least one dose of study treatment, and descriptive statistics were used to analyze all safety data in the safety population. All adverse events (AEs) were graded by NCI CTCAE v5.0. A Treatment-emergent adverse event (TEAE) was defined as an AE that had an onset date or a worsening in severity from baseline (pretreatment) on or after the date of the first dose of study drug, up to 30 days following study drug discontinuation or the initiation of a new anticancer therapy, whichever occurred first. TRAEs included TEAEs that were considered by the investigator to be related to a study drug or had a missing assessment of the causal relationship. A serious adverse event (SAE) is any untoward medical occurrence that results in death, is life-threatening, requires hospitalization or prolongation of existing hospitalization, results in disability/incapacity, is a congenital anomaly/birth defect, or is considered significant by the investigator [7,44]. Definitions of TRAEs and SAEs in CheckMate 649 was similar to RATIONALE-305 [44,54]. Table 27 provides an overview of safety events of the data cut-offs applied in the NMA of the treatments regarding Grade ≥3 TRAEs. These include DCO August 2024 for RATIONALE-305 [7] and 4-year follow-up for CheckMate 649 [54]. However, due to availability of data this section will also present safety data from DCO May 2022 for CheckMate 649 [54]. The median duration of exposure to tislelizumab or placebo was comparable between the two arms at the point of final analysis (DCO: February 28, 2023) (5.9 months [range: 0.1 to 47.0 months] versus 5.7 months [range:

0.3 to 46.9 months]). The median number of treatment cycles was 8.0 in both arms (range 1.0 to 67.0 cycles for tislelizumab and 1.0 to 68.0 cycles for placebo). More patients were exposed to tislelizumab for [redacted] than placebo [redacted] In the PD-L1 ≥5% Safety Analysis Set, the incidence of each AE category and the difference trends between arms were similar to those in the overall Safety Analysis Set**.** As of close-out analysis (DCO August 2024), the safety results after 18 months of follow-up are consistent with those reported at the final analysis (DCO February 2023). SAEs with frequency ≥1% from RATIONALE-305 are presented in Table 28 [7]. In CheckMate 649, at 4-year follow-up, no new safety signals were identified, consistent with the 3-year follow-up (DCO May 2022) [67]. [68]

Table 27. Overview of safety events.

	RATIONALE-305 (DCO August 2024) [7]			CheckMate 649, (DCO May 2022) [54]
	TIS + CT (N=498)	PBO + CT (N=494)	Difference %, (95 % CI)	NIV + CT (N= 782)

Table 29. Adverse events used in the health economic model

Adverse events	Intervention	Comparator
N/A		

Comparative safety analysis: In the absence of RCTs comparing TIS + CT to NIV + CT, an ITC was conducted for Grade ≥3 TRAEs. This analysis was based on the ITT populations from RATIONALE-305, ATTRACTION-4 Part 2, KEYNOTE-062, and KEYNOTE-859. For a detailed description of the ITC synthesis and method, see Section 7. The results from the comparative safety analysis are presented in Table 30 and showed a significantly lower incidence of grade ≥3 TRAEs was noted for TIS + CT compared to NIV + CT [7].

Table 30. Pairwise comparisons from the fixed-effects NMA for Grade ≥3 TRAE

Outcome measure	TIS + CT (N = 498)	NIV + CT (N = 1,141)	Results OR (95% CI)
Grade ≥3 TRAE	[redacted]	[redacted]	[redacted]

An OR > 1 indicates TIS + CT has a greater risk of Grade ≥3 TRAE than the comparator therapy. An OR < 1 indicates a lower risk of grade ≥3 TRAE in TIS + CT compared to the comparator therapy. Bold font indicates

statistical significance at the 0.05 level. Source: All table data has been sourced from an internal NMA report [7].

SUCRA values and probability best values are presented in Table 31. TIS + CT had the highest SUCRA value of [redacted]

Table 31. Summary of SUCRA values from the fixed-effects NMA for Grade ≥3 TRAE

Treatment Arm	SUCRA (%)	Probability Best (%)
TIS + CT	[redacted]	[redacted]
NIV + CT	[redacted]	[redacted]

10. Documentation of health-related quality of life (HRQoL)

In the following sections, HRQoL data from RATIONALE-305 and CheckMate 649 will be presented. HRQoL was measured by EORTC QLQ-C30 and EORTC QLQ-STO22 in RATIONALE-305 only, while EQ-VAS was measured both in RATIONALE-305 and CheckMate 649. HRQoL was also investigated in the NMA, however no comparison against NIV + CT was possible for the patient population with a TAP score ≥ 5% due to missing data, as EQ-VAS data was only collected in the ITT population of RATIONALE-305. Thus data presented in the following section is based on the ITT population of RATIONALE-305 and the CPS ≥ 5 population of CheckMate 649, as agreed upon with the DMC. [7]

Table 33. Overview of included HRQoL instruments

Measuring instrument	Source	Utilization
EQ-VAS	RATIONALE-305 and CheckMate 649	Clinical effectiveness

10.1 Presentation of the health-related quality of life

10.1.7 Study design and measuring instrument – RATIONALE-305

HRQoL was a secondary endpoint in the RATIONALE-305 study, measured by the three validated patient-reported outcome (PRO) questionnaires: EORTC QLQ-C30, EORTC QLQ-STO22, and EQ-VAS. In this section, HRQoL outcomes in the ITT analysis set at the time of final analysis are presented [7].

10.1.8 Study design and measuring instrument – CheckMate 649

In the CheckMate 649 study, HRQoL was measured by EQ-VAS and the Functional Assessment of Cancer Therapy-Gastric (FACT-Ga). In this submission, only the EQ-VAS results for CheckMate 649 will be presented. PROs were assessed in the overall PRO analysis population including all randomly assigned patients with an evaluable PRO assessment at baseline and at least one post-baseline assessment. Additionally, PROs were assessed in patients with a CPS of ≥5, an evaluable PRO assessment at baseline, and at least one post-baseline assessment (CPS ≥5 PRO analysis population) [62].

10.1.9 Data collection – RATIONALE-305

Patient HRQoL was measured using a validated patient-reported outcome questionnaire. Scores for the EQ-VAS were calculated and summarized for each assessment timepoint completed at baseline, at every cycle through Cycle 6, then every other cycle thereafter until PD, and at end of trial (EOT). Only patients who completed the questionnaire at baseline and had ≥1 post-baseline assessment were included in the analysis. All HRQoL measures were summarized in the ITT Analysis Set. The key clinical cycles were Cycle 4 and Cycle 6, which were selected to represent times to compare short-term and long-term treatment effects in both treatment arms, respectively. The pattern of missing data and completion for EQ-VAS is presented in Table 34. Completion rate is defined as the number of patients who completed the questionnaire divided by total number of patients in study at relevant visits in the relevant treatment arm [7].

Table 34. Pattern of missing data and completion for EQ-VAS – RATIONALE-305, ITT-population

10.1.10 Data collection – CheckMate 649

HRQoL was assessed at baseline and every 6 weeks thereafter. EQ-5D-3L was also assessed during follow-up visits 1 and 2 and every 3 months thereafter at survival follow-up visits. The statistical analysis for the PRO endpoints was descriptive and did not include hypothesis testing. The pattern of missing data and completion for EuroQol visual analogue scale (EQ VAS) in the CPS ≥5 PRO population is presented in Table 35. Compliance in the overall PRO analysis population was comparable to that of the CPS ≥5 PRO population, as shown in Table 36 [62].

10.1.11 HRQoL results – RATIONALE-305

EQ VAS: TIS + CT led to a smaller decrease in health status according to the VAS score of the EQ-5D compared to PBO + CT. The mean change from baseline in EQ VAS scores at [redacted] was [redacted] in the TIS + CT arm and [redacted] in the PBO + CT arm. At [redacted] the mean score change from baseline was [redacted] and [redacted] respectively. EQ VAS score results are presented in Table 37 and Appendix F [7].

Table 37. HRQoL EQ VAS summary statistics – RATIONALE-305

	Intervention		Comparator		Intervention vs. comparator
	N	Mean (SD)	N	Mean (SD)	Difference (95% CI) p-value

10.1.12 HRQoL results – CheckMate 649

In the CPS ≥5 PRO analysis population, EQ VAS scores generally improved from baseline at most on-treatment assessments for both treatment arms. LSM changes from baseline favored NIV + CT over PBO + CT as seen in Figure 19. Similar results were observed for the overall PRO analysis population, as seen in Appendix F [62].

Appendix A. Main characteristics of studies included

Table 52. Main characteristics of studies included

Trial name: RATIONALE-305	NCT number: NCT03777657
Objective	To evaluate the efficacy and safety of tislelizumab plus CT as 1L treatment for advanced G/GEJ adenocarcinoma compared with placebo plus CT.
Publications – title, author, journal, year	Tislelizumab plus chemotherapy versus placebo plus chemotherapy as first line treatment for advanced gastric or gastro-oesophageal junction adenocarcinoma: RATIONALE-305 randomised, double blind, phase 3 trial. Qiu et al. BMJ 2024
Study type and design	Global, randomized, double-blind, multi-centre Phase III study, patients were randomized in a 1:1 ratio into two treatment arms of either tislelizumab plus ICC or placebo plus ICC. Randomization was stratified according to region. The study was divided into a screening phase, a treatment phase, a safety follow-up phase, and a survival follow-up phase.
Sample size (n)	997
Main inclusion criteria	• Adult patients (≥18 years or according to local regulations, whichever is older) • Histologically confirmed adenocarcinoma • Locally advanced unresectable or metastatic G/GEJ adenocarcinoma • At least one measurable or non-measurable lesion per RECIST v1.1 as determined by investigator assessment • No previous systemic therapy for locally advanced, unresectable or metastatic G/GEJ cancer. NOTE: Patients could have received prior neoadjuvant or adjuvant therapy that was completed and had no recurrence or disease progression for at least 6 months • ECOG PS score of 0 or 1 • Patients were enrolled regardless of PD-L1 expression status
Main exclusion criteria	• Squamous cell or undifferentiated or other histological type G/GEJ adenocarcinoma • HER-2-positive G/GEJ adenocarcinoma • Active leptomeningeal disease or uncontrolled brain metastasis

Trial name: RATIONALE-305	NCT number: NCT03777657
	• Active autoimmune diseases or medical conditions requiring systemic corticosteroids or immunosuppressants • Prior therapy with an anti-PD-1, anti-PD-L1, anti-PD-L2, or any other antibody or drug especially targeting T cell co-stimulation or checkpoint pathways
Intervention	Initial cycles up to 6 treatment cycles: Tislelizumab 200mg IV, Day 1, Q3W + ICC doublet. Doublet A: Oxaliplatin 130mg/m^2 IV, Day 1 + Capecitabine 1000 mg/m2 orally b.i.d. for consecutive 14 days, repeated Q3W. Doublet B: Cisplatin 80 mg/m^2 IV, Day 1 + 5-FU 800 mg/m^2/day IV continuous infusion over 24 hours daily on Day 1-5, repeated Q3W. Cycle 7 and beyond: Tiselizumab 200mg IV Day 1 Q3W + Capecitabine 1000mg/m^2 orally b.i.d. for consecutive 14 days repeated Q3W.
Comparator(s)	Initial cycles up to 6 treatment cycles: Placebo + CT with ICC doublet. Doublet A: Oxaliplatin 130mg/m^2 IV, Day 1 + Capecitabine 1000 mg/m^2 orally b.i.d. for consecutive 14 days, repeated every Q3W. Doublet B: Cisplatin 80 mg/m^2 IV, Day 1 + 5-FU 800 mg/m^2/day IV continuous infusion over 24 hours daily on Day 1-5, repeated Q3W. Cycle 7 and beyond: Placebo + Capecitabine 1000mg/m^2 orally b.i.d. for consecutive 14 days, repeated Q3W.
Follow-up time	As of close-out DCO August 2024, the median follow-up time was 14.1 months (range: 0.1 to 62.2 months) for tislelizumab plus chemotherapy and 12.6 months (range: 0.3 to 59.1 months) for placebo plus CT.
Is the study used in the health economic model?	N/A
Primary, secondary and exploratory endpoints	Endpoints included in this application: The primary endpoint was OS, defined as the time from randomization to death due to any cause, assessed in patients with a PD-L1 TAP score of ≥5% and in all randomized patients (ITT population). Secondary endpoints (assessed by investigators) were PFS; safety and tolerability, assessed based on the incidence and severity of AEs; and HRQoL. Other endpoints: ORR, DoR, DCR, CBR, and TTR were included as secondary endpoints in this study, but was not included in this submission.
Method of analysis	Efficacy analyses were conducted in randomized patients with a PD-L1 TAP score of ≥5% and in all ITT patients; and in the European and North

Trial name: RATIONALE-305	NCT number: NCT03777657
	American subpopulation. All patients were included in the Safety Analysis Set. OS and PFS were analyzed using stratified log-rank test, stratified by region, PD-L1 expression and presence of peritoneal metastases. 95% CIs were calculated using Cox PH regression model. Median and cumulative probabilities of time-to-event endpoints were estimated using the Kaplan-Meier method.
Subgroup analyses	Pre-specified subgroup analyses for the primary endpoint, OS: • Region (Asia, North America/Europe) • Race (Asian, white, other) • Age (median) • Sex (female, male) • ECOG PS(0, 1) • Liver metastasis status (yes/no) • MSI-H/dMMR, MSI-L/MSS/pMMR, unknown • Presence of peritoneal metastasis (yes/no) • ICC () • Prior gastrectomy (yes/no) • Previous adjuvant or neoadjuvant therapy (yes/no) • Disease stage at screening • Number of metastatic sites (0-2, 3 or more) • PD-L1 expression status using TAP score (<5%, ≥5% (in all randomized patients))
Other relevant information	N/A

[60,66]**Table 53. Main characteristics of CheckMate649**

Trial name: CheckMate649	NCT number: NCT02872116
Objective	To assess the efficacy and safety of 1L treatment with nivolumab-plus-CT, nivolumab-plus-ipilimumab, or CT in adults with previously untreated, unresectable advanced, or metastatic GC/GEJC/EAC were enrolled, regardless of PD-L1 expression. HER-2-positive patients were excluded.

Trial name: CheckMate649	NCT number: NCT02872116
Publications – title, author, journal, year	First-Line Nivolumab Plus Chemotherapy for Advanced Gastric, Gastroesophageal Junction, and Esophageal Adenocarcinoma: 3-Year Follow-Up of the Phase III CheckMate 649 Trial. Janjigian et al. J Clin Oncol 2024.
Study type and design	Randomized, phase III study Patients were randomly assigned 1:1:1 to nivolumab plus CT, nivolumab plus ipilimumab, or CT, and then 1:1 to nivolumab plus CT versus CT once the nivolumab plus ipilimumab arm was closed. Randomization was performed using interactive web response technology with a block size of six and was stratified according to tumour cell PD-L1 status (≥1% vs <1% or indeterminate), region (Asia vs United States and Canada vs ROW), ECOG PS (0 v 1), and type of CT XELOX vs leucovorin plus FOLFOX. Investigators were not blinded to treatment allocation.
Sample size (n)	1,581
Main inclusion criteria	• Patients aged at least 18 with unresectable advanced or metastatic G/GEJ cancer or oesophageal adenocarcinoma. • Patients were eligible regardless of PD-L1 expression. • Patients had ≥1 measurable lesion or evaluable disease per RECIST v1.1, and an ECOG PS of 0 or 1. • Additional eligibility criteria included patients with adequate organ function and ability to provide a fresh or archival tumour sample to determine PD-L1 status. • Previous adjuvant or neoadjuvant CT, radiotherapy, and/or chemoradiotherapy (administered at least 6 months before random assignment) were allowed.
Main exclusion criteria	• Patients with untreated CNS metastases or peripheral neuropathy (above grade 1); active, known, or suspected autoimmune disease; positive test result for hepatitis B or hepatitis C virus; and known history of positive test for HIV or known AIDS. • Previous systemic therapy for metastatic disease. • Patients with known human EGFR2–positive status.
Intervention	Nivolumab (360 mg Q3W or 240 mg Q2W) plus ICC. XELOX: capecitabine 1000 mg/m^2 b.i.d., days 1–14 and oxaliplatin 130 mg/m^2, day 1, Q3W. FOLFOX: leucovorin 400 mg/m^2, day 1, fluorouracil 400 mg/m^2, day 1 and 1200 mg/m^2, days 1–2, and oxaliplatin 85 mg/m^2, day 1, Q2W. (nivolumab plus ipilimumab arm was closed after enrolment)

Trial name: CheckMate649	NCT number: NCT02872116
Comparator(s)	ICC alone. XELOX: capecitabine 1000 mg/m^2 b.i.d., days 1–14 and oxaliplatin 130 mg/m^2, day 1, Q3W. FOLFOX: leucovorin 400 mg/m^2, day 1, fluorouracil 400 mg/m^2, day 1 and 1200 mg/m^2, days 1–2, and oxaliplatin 85 mg/m^2, day 1, Q2W.
Follow-up time	Median follow-up was 47.4 months (range, 36.2-61.5) in the nivolumab plus CT arm and 47.3 months (range, 36.6-61.3) in the CT arm.
Is the study used in the health economic model?	N/A
Primary, secondary and exploratory endpoints	Primary Outcomes: OS by BICR per RECIST v1.1, evaluated in patients with PD-L1 CPS ≥5, defined as time from randomization to death. PFS by BICR per RECIST v1.1, evaluated in patients with PD-L1 CPS ≥5, defined as time from randomization to the date of first documented tumour progression or death. Secondary Outcomes: OS in patients with PD-L1 CPS ≥1 and all randomized patients. BICR-assessed PFS and objective response rate at different PD-L1 CPS cutoffs and in all randomized patients. Secondary outcomes: Safety was assessed by any-grade TRAE. Any TRAE leading to discontinuation was reported.
Method of analysis	OS, PFS, and DoR were assessed using Kaplan-Meier method. Forest plot for OS was made to compare patient characteristics.
Subgroup analyses	Pre-specified subgroup analyses for the primary endpoint, OS • Age (<65, 65 or older) • Sex (female, male) • Region (Asia, United States/Canada, ROW) • ECOG PS (0, 1) • Primary tumour location (GC, GEJC, EAC) • Signet ring cell carcinoma (yes/no) • Liver metastases (yes/no) • Tumour cell PD-L1 Expression (<1%, 1% or greater) • MSI status (MSS, MSI-H) • CT regimen (FOLFOX, XELOX)
Other relevant information	N/A

Appendix H. Literature searches for the clinical assessment

H.1 Efficacy and safety of the intervention and comparator(s)

A clinical SLR was conducted to support this submission. A comprehensive SLR was conducted on February 16, 2024, with an SLR update conducted on September 4, 2024.

H.1.1 Methods

The SLRs were performed in accordance with the Cochrane Handbook for Systematic Reviews of Interventions and reported in alignment with the Preferred Reporting Items for Systematic Literature Reviews and Meta-Analyses (PRISMA) statement. The Population, Intervention, Comparator, Outcome, Study design (PICOS) framework was used to develop the search strategy and structure the reporting of the eligibility criteria.

H.1.2 Original literature search

H.1.2.1 Objective

The objective was to conduct a SLR of clinical evidence to summarize the efficacy and safety data from RCTs for immune-oncology regimens in 1L, unresectable or metastatic, HER-2-negative G/GEJ adenocarcinoma in adult patients with PD-L1 TAP score of ≥5%.

H.1.2.2 Information sources

H.1.2.2.1 Bibliographic databases

Searches for RCTs were conducted with multiple databases using Ovid® Interface. The following databases were searched: Embase, Ovid MEDLINE (including, Epub Ahead of Print and In-Process & Other Non-Indexed Citations), Ovid MEDLINE Daily, CENTRAL, and the CDSR as per DMC guidelines. These original searches were performed on February 16, 2024, and are presented in Table 60.

Table 60. Bibliographic databases included in the Ovid literature search (original search)

Database	Platform/source	Relevant period for the search	Date of search completion
Embase	Ovid	1974 to February 14, 2024	16.02.2024
Ovid MEDLINE®	Ovid	1946 to February 14, 2024	16.02.2024
CENTRAL	Ovid	January 2024	16.02.2024

Database	Platform/source	Relevant period for the search	Date of search completion
CDSR	Cochrane Library	2005 to February 14, 2024	16.02.2024

H.1.2.2.2 Registry search and other sources

Additional searches of grey literature sources were conducted to maximize the inclusion of all relevant studies, including clinical registries, and reference lists of previously published reviews. The registry websites searched, presented in Table 61, were used to conduct the original SLR.

Table 61. Clinical trial registries and other sources included in the literature search (original search)

Source name	Location/source	Search strategy	Date of search
ClinicalTrials.gov	https://www.clinicaltrials.gov/	Grey literature search	16.02.2024
ANZCTR	https://www.anzctr.org.au/	Grey literature search	16.02.2024

H.1.3 Updated SLR

H.1.3.1 Objective

The updated SLR aimed to identify new literature published from the original search to September 4, 2024, concerning clinical evidence of efficacy and safety of immuno-oncology regimens for 1L treatment of unresectable, locally advanced, or metastatic G/GEJ adenocarcinoma in adults.

H.1.3.2 Information sources

H.1.3.2.1 Bibliographic databases

The bibliographic databases used to conduct the updated SLR were the same as those used for the original SLR and are presented in Table 64. The databases were searched on September 4, 2024, from database inception to ensure that all relevant data are captured.

Table 64 Overview of used databases included in literature search (updated search)

Database	Platform/source	Relevant period for the search	Date of search completion
Embase	Ovid	1974 to September 3, 2024	04.09.2024
Ovid MEDLINE®	Ovid	1946 to September 03, 2024	04.09.2024
CENTRAL	Ovid	July 2024	04.09.2024
CDSR	Cochrane Library	2005 to August 28, 2024	04.09.2024

H.1.3.2.2 Registry search and other sources

The registry websites searched presented in Table 61, were used to conduct the updated SLR.

Table 65 Clinical trial registries and other sources included in the literature search (updated search)

H.1.4 Search strategies

The search strategy was developed and tested through an iterative process by a team of medical specialists in consultation with the review team. The strategy was independently peer-reviewed by another senior medical information specialist before execution, using Peer Review of Electronic Search Strategies (PRESS) checklist [77]. The search strategy was developed based on the pre-defined PICOS criteria (Table 70). The search strategies utilized a combination of controlled vocabulary and keywords (e.g. “GC”, “GEJ”) to cover all relevant literature within the field. Modified versions of the Cochrane Highly Sensitive Seach Strategy filter for identifying RCTs in MEDLINE® and Embase were applied, in addition to filters for SLRs [77]. Vocabulary and syntax were adjusted across databases. The search strategy was not restricted by language. Animal-only and opinion pieces were removed from the results.

H.1.4.1 Original search

H.1.5 Systematic selection of studies

H.1.5.1 Eligibility criteria

Specific inclusion and exclusion criteria were applied to the SLR to ensure the relevance and quality of identified evidence. Only RCTs were included, utilizing a balanced RCT filter specifically tailored for Ovid MEDLINE. The search was restricted to studies conducted in humans and involving adult populations (18 years and older). To ensure inclusion of the most recent evidence, only abstracts published within the last two years were retained from Embase and CENTRAL. Additionally, trial protocols and opinion-based publications, such as commentaries or editorials, were removed.

Study eligibility was assessed according to pre-specified PICOS criteria, identical for the original and updated SLR, as specified in Table 70. Articles that met all the inclusion criteria and did not include any exclusion criteria were included.

Table 70. Inclusion and exclusion criteria used for assessment of studies

Clinical effectiveness	Inclusion criteria	Exclusion criteria	Changes, local adaption
Population	1L unresectable, locally advanced, or metastatic HER-2-negative G/GEJ adenocarcinoma Adult patients	2L or later GC/GEJ adenocarcinoma HER-2-positive patients Other Cancers Pediatric patients (< 18 years)	All criteria applied
Intervention	Immuno-oncology treatments (PD-L1 inhibitors, immune checkpoint inhibitors, etc.) Other targeted therapies (TKIs, EGFR inhibitors, VEGFR-2 inhibitors, CLDN12.2 inhibitors, FGFR2b inhibitors, etc.) Chemotherapy	Those not listed	All criteria applied
Comparators	Any interventions above (alone or in combination with chemotherapy/targeted therapy/any other immunotherapy) Placebo	Those not listed	All criteria applied
Outcomes	OS, PFS, ORR, DoR, HRQoL, AE, ToT	Any study not including at least	All criteria applied

		one eligible outcome	
Study design/publication type	Phase II and phase III RCTs	Phase I and IV RCTs Non-randomized studies	All criteria applied
Date	Full text articles from database inception to present Conference abstracts (2022 to 2024)	Conference abstracts prior to 2022 Those not listed	
Language restrictions	English language articles	Non-English articles	All criteria applied

H.1.5.2 Systematic review process

Records were identified and imported into EndNote X9, and duplicates were removed prior to exporting to the systematic review software for study selection. Study selection was conducted by two reviewers who independently reviewed the study records, citation titles, and abstracts to assess eligibility based on the pre-defined PICOS criteria. Duplicates were quarantined from the final screening list prior to study selection. Reviewers documented their reasons for exclusion, and any discrepancies between the two reviewers were resolved by consensus or were referred to and resolved by a third independent reviewer not involved in the study selection process.

Records considered to describe potentially eligible studies were independently reviewed by two reviewers in full-text form for formal inclusion in the review. Records that did not meet the inclusion criteria were excluded, and the reason for exclusion was recorded at the full-text screening. Any discrepancies between the two reviewers were resolved by consensus or were referred to and resolved by a third independent reviewer not involved in the study selection process. Included full-text articles were further validated for inclusion during the data extraction phase. This involved reviewing the study design details, baseline population characteristics, and efficacy and safety endpoints.

H.1.5.3 Data extraction

Data from the publications identified in this review were extracted into a standardized form in Microsoft® Excel (Microsoft Corporation, Seattle, US). Extracted data was based on the pre-defined PICOS criteria (Table 70) and was performed in the following steps:

1. Written instructions on outcomes to be extracted from articles, pilot testing of the extraction form, resolution of potential ambiguities, and differences in interpretation of findings were performed.
2. Information from the full-text articles of the studies accepted for inclusion was extracted independently by one investigator into the data extraction forms. Secondary references and conference material related to a given study were reviewed to see if there was any additional data to extract.
3. Data extraction was independently validated by a second investigator. A third investigator was consulted to resolve any disagreements if necessary.
4. For added quality assurance, there was a final data check once all relevant information was extracted.

If relevant survival endpoint data (i.e., OS or PFS were not available as hazard ratios from the text or tables of the article, then manual calculations of this information from the publication's Kaplan–Meier graphs were performed by digitalizing the relevant curves using DigitizeIt [78].

The specific data elements that were captured from included studies are summarized below:

- Publication characteristics (citation data, trial identifying information, year, study sponsor, objective)
- Study setting (countries, centers/hospitals)
- Study methods (design [parallel-group, crossover, etc.], duration, follow-up length, patient enrollment criteria, interventions administered, dosing regimens, randomization details, blinding details, concomitant therapies allowed, outcomes assessed, approach to statistical analysis [intention to treat, per protocol, etc.])
- Study participant characteristics (age, sex, ethnicity, geographic region, weight, body mass index [BMI], primary cancer diagnosis, histology, mutation status, microsatellite instability (MSI) status, Eastern Cooperative Oncology Group [ECOG] performance status, disease status at trial entry [metastatic, recurrent, unresectable advanced], HER-2 status, metastatic site, number of metastatic sites, PD-1/PD-L1 expression/status, Lauren classification status, smoking status, comorbidities, and prior therapy)
- Efficacy outcomes (i.e., OS, PFS, objective response rate (ORR); including CR and partial response [PR]), duration of response (DoR), time on treatment (ToT), and HRQoL)
- Safety outcomes including aggregate safety outcomes (i.e., any AE, SAE, withdrawals due to AEs), and individual AEs of interest (i.e., anemia, nausea, neutropenia, and neutrophil count decreases). For each safety outcome, data fotreatment-related and TEAEs was captured, as reported.

For any single outcome, data were extracted for the longest available follow-up time point using the latest available data cut for that outcome. Extraction of the following key subgroups was performed:

- PD-1/PD-L1 expression
  - PD-1/PD-L1 positive subgroups were defined as: TAP ≥5%, CPS ≥1, 5 or 10, tumour proportion score (TPS) ≥1%, 5% or 10%.
  - PD-1/PD-L1 negative subgroups were defined as: TAP <5%, CPS < 1, 5 or 10, TPS < 1%, 5% or 10%).
- Race (e.g., Asian patients)
- Geography/region (e.g., Asia)
- Histology based on Lauren classification (diffused vs intestinal)
- MSI status
- GC vs GEJ site

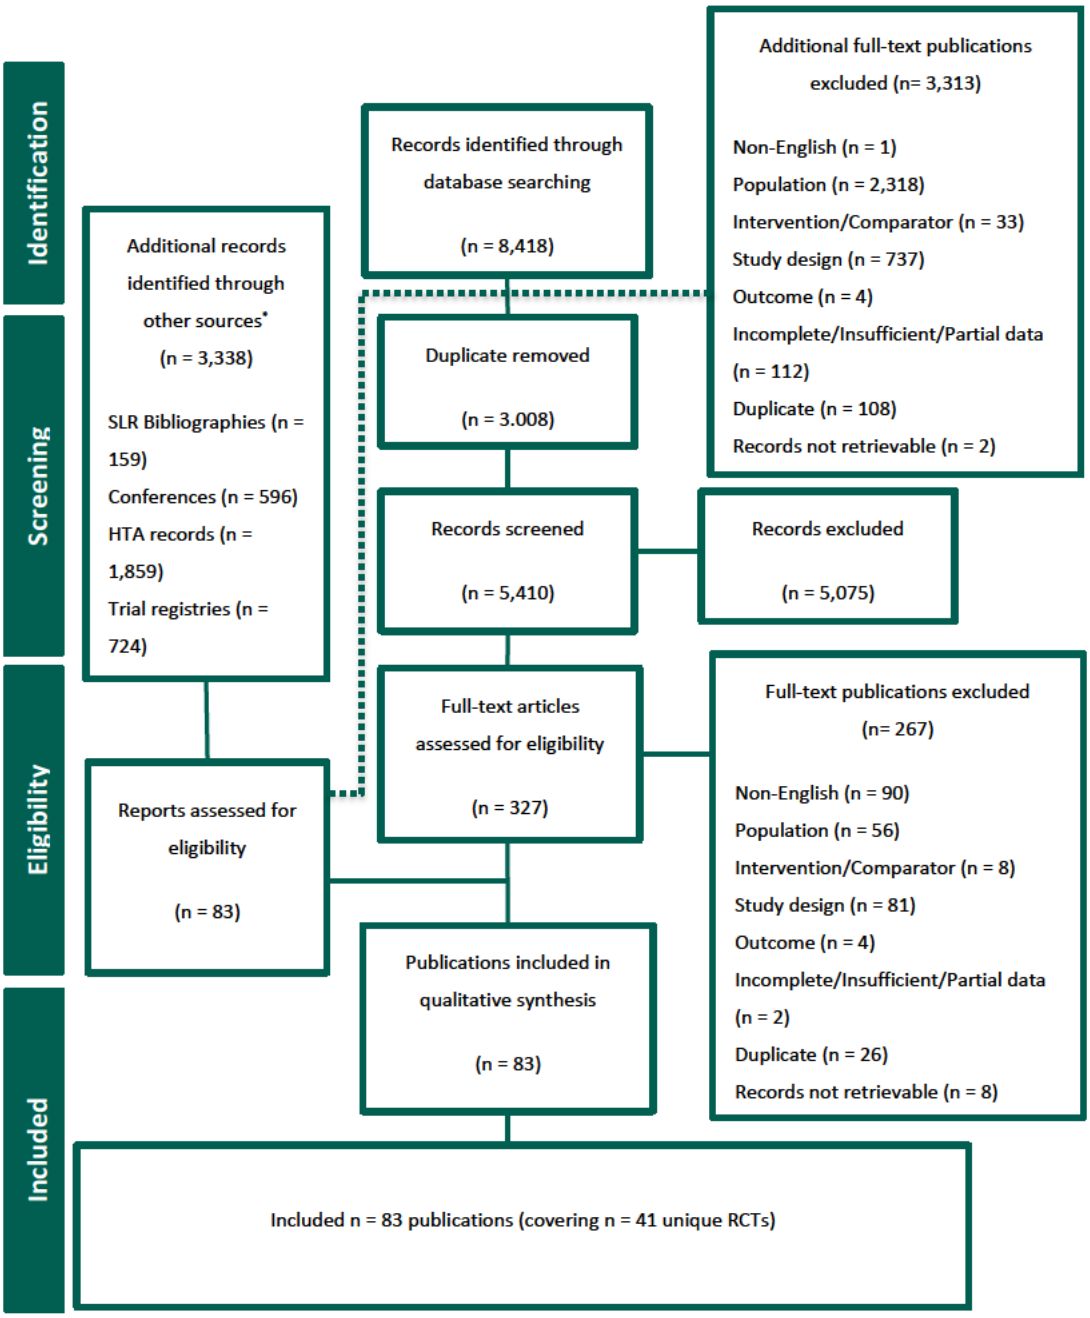
H.1.5.4 Study selection process

H.1.5.4.1 Original SLR

The original SLR electronic database search conducted on February 16, 2024, identified 8,418 records. After removing 3,008 duplicates, the resulting 5,410 records were screened and 5,075 were excluded. The remaining 335 full-text records were sought for retrieval; of these, 8 records were not retrievable. Of the 327 remaining reports assessed for eligibility, 267 were removed for various reasons as shown in the PRISMA flow diagram (Figure 21).

A search of grey literature sources identified an additional 3,338 records. Searches of key clinical conferences identified 596 records and searches of clinical trial registries identified 724 records. An additional 1,859 records were identified through searching of key HTA agencies. Finally, a search of bibliographies of key relevant SLRs identified 159 records. Of the 3,338 records identified, two were not retrievable. The remaining 3,336 reports were then assessed for further eligibility. After assessment, 3,313 reports were then excluded for reasons shown in the PRISMA flow diagram (Figure 21).

Figure 21. PRISMA flow diagram of clinical evidence identified from the original SLR (February 16, 2024)

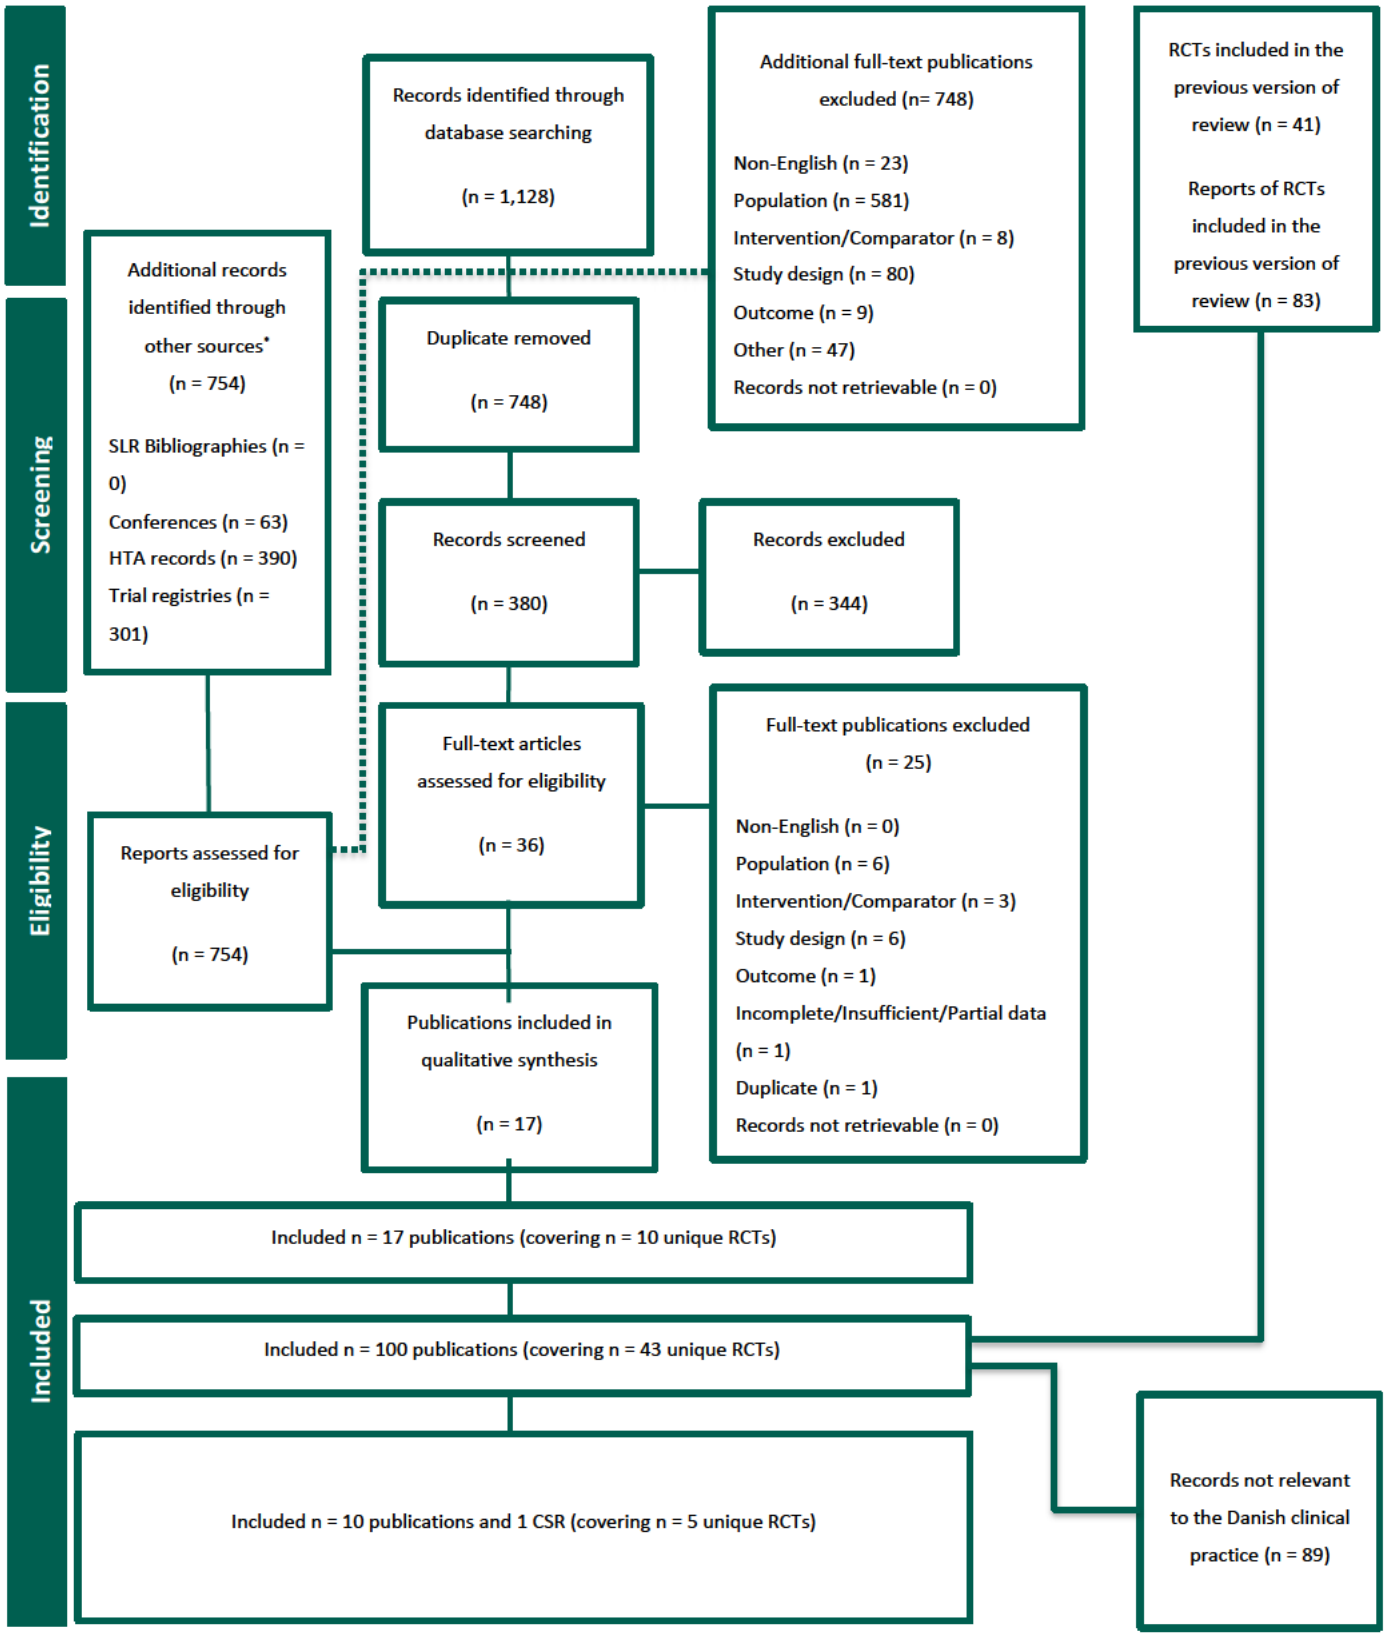


H.1.5.4.2 Updated SLR

The updated SLR conducted on September 4, 2024, identified 1,128 records from databases and registers (i.e., MEDLINE, Embase, CENTRAL, and Cochrane), and 748 duplicate records were removed prior to screening. After de-duplication, 380 records were screened. Of these, 344 were excluded at the title and abstract stage. Thirty-six full-text records were retrieved and assessed for eligibility, and 25 were removed for various reasons as shown in the PRISMA flow diagram (Figure 22).

Furthermore, the updated search of grey literature sources identified a total of 754 records. Searches of key clinical conferences identified 63 records and searches of clinical trial registries identified 301 records. An additional 390 records were identified through searching of key HTA agencies. No eligible SLRs were identified for bibliography screening. After assessment of the 754 identified records, 748 reports were excluded for the reasons shown in the PRISMA flow diagram (Figure 22).

Figure 22. PRISMA flow diagram of clinical evidence identified from the updated SLR (September 4, 2024) and overall SLR



H.1.5.4.3 Overall SLR

In total, the original and updated searches identified 100 records reporting on 43 unique RCTs. The updated search identified 17 new reports pertaining to 10 unique RCTs. Of these, two reports pertained to two newly identified RCTs (RELATIVITY-060 and CTRI/2020/03/023944), while the remaining fifteen records represented additional or updated analyses pertaining to RCTs identified in the original review. The study selection process is reported in a PRISMA flow diagram and presented in Figure 22.

Relevance to Danish clinical practice:
To support this submission, it was essential to identify evidence specifically relevant to Danish clinical practice and the treatment regimen for unresectable, locally advanced or metastatic G/GEJ adenocarcinoma. As a result, 90 records were excluded from the overall SLR due to lack of relevance to the Danish treatment context. Following this refinement, a total of 10 records were identified and included as final evidence. The study selection process is reported in a PRISMA flow diagram and presented in Figure 22. While not explicitly identified through the SLR process, and thereby not presented in the PRISMA flow diagram, data from the Tables, Figures, and Listings (TFL), and the clinical study report (CSR) of the RATIONALE-305 trial (provided by BeiGene) were used to supplement published data for this trial.

A list of all records selected for inclusion in the SLR is provided in Table 71, and a list of all records excluded at the full-text stage with reasons for exclusion is provided in Table 72 and Table 73 for the original SLR and updated SLR respectively. Additionally, a list of all records excluded following assessment of relevance to the Danish treatment context is provided in Table 74.

H.1.5.5 Summary of included studies

Table 71 Overview of study design for studies included in the analyses

Study/ID	Aim	Study design	Patient population	Intervention and comparator (sample size (n))	Primary outcome and follow-up period	Secondary outcome and follow-up period
RATIONALE-305 [44] NCT03777657	Comparison of efficacy and safety of tislelizumab plus CT vs placebo plus CT as 1L treatment of advanced G/GEJ adenocarcinoma	Double-blinded phase III, RCT	Patients with HER-2 -negative, locally advanced, unresectable, or metastatic G/GEJ adenocarcinoma, regardless of PD-L1 expression, who had not received systemic anticancer therapy for advanced disease.	TIS + CT (n=501) PBO + CT (n=496)	OS (Time frame: 42.5 months)	PFS, ORR, disease control rate, clinical benefit rate, TTR, DoR (Time frame: 42.5 months)
ATTRACTION-4 [60,66] NCT02746796	Comparison of efficacy and safety of nivolumab plus CT vs placebo plus CT in HER-2-negative, previously untreated,	Double-blinded, phase III, RCT	Patient with previously untreated HER-2 -negative, unresectable, advanced or	NIV + CT (n=362)	PFS and OS (Time frame: 36 months)	Tumour response, ORR, DCR, best overall response, DOR, TTR (Time frame: 36 months)

Study/ID	Aim	Study design	Patient population	Intervention and comparator (sample size (n))	Primary outcome and follow-up period	Secondary outcome and follow-up period
	unresectable, advanced, or recurrent G/GEJ cancer		recurrent G/GEJ cancer	PBO + CT (n=362)		
CheckMate 649 [54,62,69] NCT02872116	Comparison of nivolumab plus CT vs CT as 1L treatment of advanced G/GEJ cancer/gastroesophageal adenocarcinoma	Open label, phase III, RCT	Patients with previously untreated HER-2-negative, advanced or metastatic G/GEJ cancer/gastroesophageal adenocarcinoma regardless of PD-L1 expression	NIV + CT (n=789) CT (n=792) NIV + ipilimumab(n=409) CT (n=404)	OS and PFS (Time frame: 47.4 months) HRQoL by EQ-5D-5L, EQ VAS and the FACT-Ga (timeframe: follow-up after 30 days of last dose, 84 days after initial follow-up and every 3 months after)	ORR, DoR, TTSD (Time frame: 47.4 months)
KEYNOTE-062 [56,68]	Comparison of efficacy and safety of pembrolizumab vs	Partially blinded, phase III, RCT	Patients with previously untreated G/GEJ cancer,	PEM (n=256)	OS and PFS in patients with PD-L1 CPS of 1 or greater or	ORR, DoR, GHS/QoL, EORTC QLQ-C30, EORTC QLQ-STO22

Study/ID	Aim	Study design	Patient population	Intervention and comparator (sample size (n))	Primary outcome and follow-up period	Secondary outcome and follow-up period
NCT02494583	pembrolizumab plus CT vs CT alone in 1L treatment of untreated, advanced, G/GEJ cancer		advanced disease with PD-L1 CPS of 1 or greater	PEM + CT (n=257) PBO + CT (n=250)	10 or greater (Time frame: 54.3 months)	(Time frame: 54.3 months)
KEYNOTE-859 [59] NCT03675737	Comparison of efficacy and safety of pembrolizumab plus CT vs placebo plus CT in HER-2 negative, advanced GC patients	Double-blinded, phase III, RCT	Patients with previously untreated, locally advanced, unresectable or metastatic HER-2-negative G/GEJ adenocarcinoma	PEM + CT (n=790) PBO + CT (n=789)	OS (Time frame: 31.0 months)	PFS, ORR, DoR (Time frame: 31.0 months)

1	Al-Batran, S. E., Shitara, K., Folprecht, G., Moehler, M. H., Goekkurt, E., Ben-Aharon, I., Lonardi, S., Stein, S., Hubert, A., Chau, I., Mishaeli, M., Villanueva, L., Kavan, P., Fang, X., Shih, C. S., Bhagia, P., Wyrwicz, L. S. (2024). Pembrolizumab plus FLOT vs FLOT as neoadjuvant and adjuvant therapy in locally advanced gastric and gastroesophageal junction cancer: Interim analysis of the phase 3 KEYNOTE-585 study Journal of Clinical Oncology, 42(3 Supplement), #Pages#	POPULATION
2	Kang, Y. K., Terashima, M., Kim, Y. W., Boku, N., Chung, H. C., Chen, J. S., Ji, J., Yeh, T. S., Chen, L. T., Ryu, M. H., Kim, J. G., Omori, T., Rha, S. Y., Kim, T. Y., Ryu, K. W., Sakuramoto, S., Nishida, Y., Fukushima, N., Yamada, T., Bai, L. Y., Hirashima, Y., Hagihara, S., Nakada, T., Sasako, M. (2024). Adjuvant nivolumab plus chemotherapy versus placebo plus chemotherapy for stage III gastric or gastro-oesophageal junction cancer after gastrectomy with D2 or more extensive lymph-node dissection (ATTRACTION-5): a randomised, multicentre, double-blind, placebo-controlled, phase 3 trial The Lancet Gastroenterology and Hepatology, 9(8), 705-717	POPULATION

No.	Reference	Reason for exclusion
3	Lin, J. X., Tang, Y. H., Zheng, H. L., Ye, K., Cai, J. C., Cai, L. S., Lin, W., Xie, J. W., Wang, J. B., Lu, J., Chen, Q. Y., Cao, L. L., Zheng, C. H., Li, P., Huang, C. M. (2024). Neoadjuvant camrelizumab and apatinib combined with chemotherapy versus chemotherapy alone for locally advanced gastric cancer: a multicenter randomized phase 2 trial Nature communications, 15(1), 41	POPULATION
4	Qian, Y., Zhai, E., Ye, J., Chen, S., Yuan, K., Wang, Z., Xu, J., Zhang, X., Ma, J., Chen, C., Peng, J., Chen, J., Cai, S. (2024). Efficacy and safety of cadonilimab and COX-2 inhibitor combined with oxaliplatin and capecitabine (XELOX) in perioperative treatment for locally advanced resectable gastric adenocarcinoma: A prospective, single-center, randomized, phase II trial Annals of Oncology, 35(Supplement 1), S196	POPULATION
5	Shitara, K., Rha, S. Y., Wyrwicz, L. S., Oshima, T., Karaseva, N., Osipov, M., Yasui, H., Yabusaki, H., Afanasyev, S., Park, Y. K., Al-Batran, S. E., Yoshikawa, T., Yanez Weber, P. E., Di Bartolomeo, M., Lonardi, S., Fang, X., Shih, C. S., Bhagia, P., Bang, Y. J. (2024). Final analysis of the phase III KEYNOTE-585 study of pembrolizumab plus chemotherapy vs chemotherapy as perioperative therapy in locally-advanced gastric and gastroesophageal junction cancer Annals of Oncology, 35(Supplement 1), S213	POPULATION
6	Verschoor, Y. L., van de Haar, J., van den Berg, J. G., van Sandick, J. W., Kodach, L. L., van Dieren, J. M., Balduzzi, S., Grootscholten, C., M.E, I. Jsselsteijn, Veenhof, A. A. F. A., Hartemink, K. J., Vollebergh, M. A., Jurdi, A., Sharma, S., Spickard, E., Owers, E. C., Bartels-Rutten, A., den Hartog, P., de Miranda, N. F. C. C., van Leerdam, M. E., Haanen, J. B. A. G., Schumacher, T. N., Voest, E. E., Chalabi, M. (2024). Neoadjuvant atezolizumab plus chemotherapy in gastric and gastroesophageal junction adenocarcinoma: the phase 2 PANDA trial Nature Medicine, 30(2), 519-530	POPULATION
7	Chang, L., Zhang, X., Ma, Q., Kong, L., Yu, Y., Tao, J., Li, Q. (2024). Safety and efficacy of apatinib in combination with chemotherapy with or without immunotherapy versus chemotherapy alone as first-line treatment for advanced gastric cancer Investigational New Drugs, 42(2), 161-170	INTERVENTION/COMPARATOR
8	Jiang, Z., Xie, Y., Zhang, W., Du, C., Zhong, Y., Zhu, Y., Jiang, L., Dou, L., Shao, K., Sun, Y., Xue, Q., Tian, Y., Gao, S., Zhao, D., Zhou, A. (2024). Perioperative chemotherapy with docetaxel plus oxaliplatin and S-1 (DOS) versus oxaliplatin plus S-1 (SOX) for the treatment of locally advanced gastric or gastro-esophageal junction adenocarcinoma (MATCH): an open-label, randomized, phase 2 clinical trial Gastric Cancer, 27(3), 571-579	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
9	Wang, Teng, Zhang, Li-Yun (2024). Evaluation of oxaliplatin and tigio combination therapy in locally advanced gastric cancer World journal of gastrointestinal surgery, 16(6), 1709-1716	INTERVENTION/COMPARATOR
10	Botsen, D., Chabaud, S., Perrier, H., Ammarguellat, H., Jestin-Le-Tallec, V., Olesinski, J., Toullec, C., Aparicio, T., Ben Abdelghani, M., Borg, C., Bouche, O., Coutzac, C., Devaud, H., Di Fiore, F., Dubreuil, O., Evesque, L., Huguenin, B., Muller, M., Poureau, P. G., Oularue, E., Tougeron, D., Zaanan, A., Ammari, S., De Sousa Carvalho, N., Decazes, P., De La Fouchardiere, C. (2024). Trifluridine/tipiracil + oxaliplatin ± nivolumab vs FOLFOX ± nivolumab in HER2 negative advanced oesogastric adenocarcinoma: the PRODIGE73-UCGI40-LOGICAN trial Digestive and liver disease, #volume#(#issue#), #Pages#	STUDY DESIGN
11	Cai, L., Qu, L., Cheng, Y., Zhang, J., Li, S., Wu, S. (2024). Study on the therapeutic effect of sintilimab combined with modified DCF regimen on advanced gastric cancer and its impact on Th1/Th2 immune balance Anti-Cancer Drugs, 35(8), 780-788	STUDY DESIGN
12	de la Fouchardiere, C., Chabaud, S., Perrier, H., Ammarguellat, H., Jestin, V., Olesinski, J., Toullec, C., Aparicio, T., Ben Abdelghani, M., Bouche, O., Coutzac, C., Dubreuil, O., Evesque, L., Muller, M., Poureau, P. G., Soularue, E., Tougeron, D., Zaanan, A., De Sousa Carvalho, N., Botsen, D. (2024). Randomised phase II study evaluating trifluridine/tipiracil (FTD/TPI) plus oxaliplatin +/- nivolumab versus FOLFOX +/- nivolumab in patients with HER2-negative locally advanced, recurrent or metastatic gastric, oesophageal or junctional adenocarcinoma (aGA/GEJA) (PRODIGE 73 - LOGICAN) Annals of Oncology, 35(Supplement 1), S197-S198	STUDY DESIGN
13	Kim, H. D., Shin, J., Song, I. H., Hyung, J., Lee, H., Ryu, M. H., Park, Y. S. (2024). Discordant PD-L1 results between 28-8 and 22C3 assays are associated with outcomes of gastric cancer patients treated with nivolumab plus chemotherapy Gastric Cancer, 27(4), 819-826	STUDY DESIGN
14	Shen, L., Shitara, K., Chen, J. S., Oh, D. Y., Jiang, A., Liu, S., Dong, Z., Zhu, Q., Kumar, R., Rha, S. Y. (2024). GEMINI-Gastric: A phase 2 study of novel treatment combinations in patients with locally advanced unresectable or metastatic gastric cancers Journal of Clinical Oncology, 42(16 Supplement), #Pages#	STUDY DESIGN
15	Utsumi, M., Yukami, H., Okemoto, D., Kadono, T., Yamaguchi, T., Goto, M., Nishikawa, H. (2024). Impact of adding nivolumab to first-line chemotherapy in patients with advanced gastric cancer Journal of Clinical Oncology, 42(3 Supplement), #Pages#	STUDY DESIGN
16	Hirano, H., Yamada, Y., Nagashima, K., Hiraoka, N., Sekine, S., Takahashi, N., Azuma, M., Iwasa, S., Kanato, K., Machida, N., Kinoshita, T., Hata, H., Kawakami, H., Takahari, D., Ojima, T., Kadowaki, S., Boku, N., Kurokawa, Y., Terashima, M., Yoshikawa, T.	OUTCOME

No.	Reference	Reason for exclusion
	(2024). Impact of PD-L1 expression on survival in patients with unresectable/recurrent gastric cancer receiving first-line chemotherapy without immune checkpoint inhibitors Journal of Clinical Oncology, 42(3 Supplement), #Pages#	
17	ClinicalTrials.gov. (2024). A Study to Investigate the Efficacy and Safety of ONO-4578 in Combination With Nivolumab and Chemotherapy in Chemotherapy-naïve Participants With HER2-negative Unresectable Advanced or Recurrent Gastric Cancer (Including Esophagogastric Junction Cancer) A Randomized, Multicenter, Double-blind, Phase II Study to Compare the Efficacy and Safety of the Treatment With ONO-4578 in Combination With Nivolumab, Fluoropyrimidine-based and Platinum- Based Chemotherapy (Hereinafter Referred to as Chemotherapy) With Those of the Treatment With Placebo in Combination With Nivolumab and Chemotherapy in Chemotherapy-naïve Participants With Human Epidermal Growth Factor Receptor 2 (HER2)-Negative Unresectable Advanced or Recurrent Gastric Cancer (Including Esophagogastric Junction Cancer), #volume#(#issue#), #Pages#	INCOMPLETE/INSUFFICIENT/PARTIAL DATA
18	Arkenau, H. T., Tabernero, J., Cruz-Correa, M., Zimina, A. V., Poddubskaya, E., Moiseenko, F. V., Spigel, D. R., Wyrwicz, L. S., Disel, U., Cid, R. P., Gracian, A. C., Ales Diaz, I., Fornaro, L., Evesque, L., Xu, Y., Sheng, T., Yang, S., Li, L., Moehler, M. H., Xu, R. H. (2024). Tislelizumab plus chemotherapy (chemo) versus placebo plus chemo as first-line treatment for locally advanced unresectable or metastatic gastric or gastroesophageal junction adenocarcinoma: RATIONALE-305 European/North American patient subgroup Journal of Clinical Oncology, 42(3 Supplement), #Pages#	DUPLICATE
19	Botsen, D., Chabaud, S., Perrier, H., Ammarguellat, H., Jestin-Le-Tallec, V., Olesinski, J., Toullec, C., Aparicio, T., Ben Abdelghani, M., Borg, C., Bouche, O., Coutzac, C., Devaud, H., Di Fiore, F., Dubreuil, O., Evesque, L., Huguenin, B., Muller, M., Poureau, P. G., Oularue, E., Tougeron, D., Zaanan, A., Ammari, S., De Sousa Carvalho, N., Decazes, P., De La Fouchardiere, C. (2024). Trifluridine/tipiracil + oxaliplatin +/- nivolumab vs FOLFOX +/- nivolumab in HER2 negative advanced oesogastric adenocarcinoma: The PRODIGE73-UCGI40-LOGICAN trial Digestive and Liver Disease, 56(8), 1281-1287	DUPLICATE
20	Cruz-Correa, M., Xu, R. H., Moehler, M. H., Oh, D. Y., Kato, K., Spigel, D. R., Arkenau, H. T., Tabernero, J., Zimina, A. V., Bai, Y., Shi, J., Lee, K. W., Hirano, H., Wyrwicz, L. S., Cid, R. P., Xu, H., Sheng, T., Barnes, G. (2024). Tislelizumab (TIS) plus chemotherapy (Chemo) vs placebo (PBO) plus chemo as first-line (1L) treatment of advanced gastric or gastroesophageal junction adenocarcinoma (GC/GEJC): Health-related quality of life (HRQoL) outcomes in the RATIONALE-305 study Journal of Clinical Oncology, 42(3 Supplement), #Pages#	DUPLICATE

No.	Reference	Reason for exclusion
21	Lin, D., Quan, W., Garretson, M., Chirikov, V. V., Chen, C., Singh, P., Davis, C., Sugarman, R. (2024). Q-TWiST analysis of nivolumab + chemotherapy versus chemotherapy as first-line (1L) treatment for advanced gastric cancer, gastroesophageal junction cancer, or esophageal adenocarcinoma (GC/GEJC/EAC) in patients with PD-L1 CPS>=1 and CPS>=5: 4-year follow-up from CheckMate 649 (CM 649) Annals of Oncology, 35(Supplement 1), S170	DUPLICATE
22	Shen, L., Bai, Y., Lin, X., Li, W., Wang, J., Zhang, X., Pan, H., Bai, C., Bai, L., Cheng, Y., Zhang, J., Zhong, H., Ba, Y., Hu, W., Xu, R. H., Guo, W., Qin, S., Wang, R., McCraith, S., Liu, T. (2024). First-line (1L) nivolumab (NIVO) plus chemotherapy (chemo) vs chemo in patients (pts) with advanced gastric cancer, gastroesophageal junction cancer, and esophageal adenocarcinoma (GC/GEJC/EAC): CheckMate 649 Chinese subgroup analysis 4-year (yr) follow-up Journal of Clinical Oncology, 42(3 Supplement), #Pages#	DUPLICATE
23	Shitara, K., Moehler, M. H., Ajani, J. A., Shen, L., Garrido, M., Gallardo, C., Wyrwicz, L. S., Yamaguchi, K., Cleary, J. M., Elimova, E., Maya, R. E. B., Karamouzis, M., Skoczylas, T., Bragagnoli, A., Liu, T., Tehfe, M., Feeney, K., Wang, R., Nathani, R., Janjigian, Y. Y. (2024). Nivolumab (NIVO) + chemotherapy (chemo) vs chemo as first-line (1L) treatment for advanced gastric cancer/gastroesophageal junction cancer/esophageal adenocarcinoma (GC/GEJC/EAC): 4 year (yr) follow-up of CheckMate 649 Journal of Clinical Oncology, 42(3 Supplement), #Pages#	DUPLICATE
24	Wainberg, Z. A., Kang, Y. K., Lee, K. W., Qin, S., Yamaguchi, K., Kim, I. H., Saeed, A., Oh, S. C., Li, J., Turk, H. M., Teixeira, A., Hitre, E., Udrea, A. A., Cardellino, G. G., Sanchez, R. G., Zahlten-Kumeli, A., Taylor, K., Enzinger, P. C. (2024). Bemarituzumab as first-line treatment for locally advanced or metastatic gastric/gastroesophageal junction adenocarcinoma: final analysis of the randomized phase 2 FIGHT trial Gastric Cancer, 27(3), 558-570	DUPLICATE
25	Wainberg, Z. A., Shiu, K. K., Rivera, F., Medley, L. C., Aghmesheh, M., Dunne, R. F., Roy, R., Wyrwicz, L. S., Larson, T., Metges, J. P., Mansoor, W., Goekkurt, E., Antunes, L. C. M., Oliden, V. C., Jensen, E., Shah, S., Bordia, S., Bhagia, P., Lowery, M. A. (2024). First-line pembrolizumab (pembro) plus chemotherapy (chemo) for advanced gastroesophageal junction cancer (GEJC) and esophageal adenocarcinoma (EAC): Analysis of KEYNOTE-590 and KEYNOTE-859 by tumor type Journal of Clinical Oncology, 42(3 Supplement), #Pages#	DUPLICATE

H.1.6.3 Local adaptation

Table 74 Studies excluded from the clinical SLR following assessment of relevance to the Danish treatment context (overall search)

No.	Reference	Reason for exclusion
1	Rosati G, Cella CA, Cavanna L, Codeca C, Prisciandaro M et al. (2022) A randomized phase III study of fractionated docetaxel, oxaliplatin, capecitabine (low-tox) vs epirubicin, oxaliplatin and capecitabine (eox) in patients with locally advanced unresectable or metastatic gastric cancer: the lega trial. *Gastric Cancer* 25 (4): 783-793	INTERVENTION/COMPARATOR
2	Zhu XD, Huang MZ, Wang YS, Feng WJ, Chen ZY et al. (2022) XELOX doublet regimen versus EOX triplet regimen as first-line treatment for advanced gastric cancer: An open-labeled, multicenter, randomized, prospective phase III trial (EXELOX). *Cancer Commun (Lond)* 42 (4): 314-326	INTERVENTION/COMPARATOR
3	Hogner A, Al-Batran SE, Siveke JT, Lorenz M, Bartels P et al. (2022) Pazopanib with 5-FU and oxaliplatin as first line therapy in advanced gastric cancer: A randomized phase-II study-The PaFLO trial. A study of the Arbeitsgemeinschaft Internistische Onkologie AIO-STO-0510. *Int J Cancer* 150 (6): 1007-1017	INTERVENTION/COMPARATOR
4	Bin Y, Lan D, Bao W, Yang H, Zhou S et al. (2022) SOX combined with intraperitoneal perfusion of docetaxel compared with DOS regimen in the first-line therapy for advanced gastric cancer with malignant ascites: a prospective observation. *Trials* 23 (1): 211	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
5	Dai Y-H, Yu X-J, Xu H-T, Zhuang L, Zhang M-S et al. (2022) Nab-paclitaxel plus S-1 versus oxaliplatin plus S-1 as first-line treatment in advanced gastric cancer: results of a multicenter, randomized, phase III trial (GAPSO study). *Therapeutic advances in medical oncology* 14 17588359221118020	INTERVENTION/COMPARATOR
6	Sahin U, Tureci O, Manikhas G, Lordick F, Rusyn A et al. (2021) FAST: a randomised phase II study of zolbetuximab (IMAB362) plus EOX versus EOX alone for first-line treatment of advanced CLDN18.2-positive gastric and gastro-oesophageal adenocarcinoma. *Ann Oncol* 32 (5): 609-619	INTERVENTION/COMPARATOR
7	Shah MA, Bodoky G, Starodub A, Cunningham D, Yip D et al. (2021) Phase III Study to Evaluate Efficacy and Safety of Andecaliximab With mFOLFOX6 as First-Line Treatment in Patients With Advanced Gastric or GEJ Adenocarcinoma (GAMMA-1). *J Clin Oncol* 39 (9): 990-1000	INTERVENTION/COMPARATOR
8	Kawakami H, Fujitani K, Matsuyama J, Akamaru Y, Tamura S et al. (2020) Comparison of S-1-cisplatin every 5 weeks with capecitabine-cisplatin every 3 weeks for HER2-negative gastric cancer (recurrent after S-1 adjuvant therapy or chemotherapy-naive advanced): pooled analysis of HERBIS-2 (OGSG 1103) and HERBIS-4A (OGSG 1105) trials. *Int J Clin Oncol* 25 (9): 1635-1643	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
9	Kang YK, Chin K, Chung HC, Kadowaki S, Oh SC et al. (2020) S-1 plus leucovorin and oxaliplatin versus S-1 plus cisplatin as first-line therapy in patients with advanced gastric cancer (SOLAR): a randomised, open-label, phase 3 trial. *Lancet Oncol* 21 (8): 1045-1056	INTERVENTION/COMPARATOR
10	Nakajima TE, Yamaguchi K, Boku N, Hyodo I, Mizusawa J et al. (2020) Randomized phase II/III study of 5-fluorouracil/l-leucovorin versus 5-fluorouracil/l-leucovorin plus paclitaxel administered to patients with severe peritoneal metastases of gastric cancer (JCOG1108/WJOG7312G). *Gastric Cancer* 23 (4): 677-688	INTERVENTION/COMPARATOR
11	Lee KW, Zang DY, Ryu MH, Han HS, Kim KH et al. (2023) A Phase 3 Randomized Clinical Trial to Compare Efficacy and Safety between Combination Therapy and Monotherapy in Elderly Patients with Advanced Gastric Cancer (KCSG ST13-10). Cancer Research and Treatment 55 (4): 1250-1260	INTERVENTION/COMPARATOR
12	Yoshikawa T, Muro K, Shitara K, Oh DY, Kang YK et al. (2019) Effect of First-line S-1 Plus Oxaliplatin With or Without Ramucirumab Followed by Paclitaxel Plus Ramucirumab on Advanced Gastric Cancer in East Asia: The Phase 2 RAINSTORM Randomized Clinical Trial. JAMA Netw Open 2 (8): e198243	INTERVENTION/COMPARATOR
13	Kim C, Chon HJ, Kim JH, Jung M, Nam CM et al. (2019) Randomised phase II trial comparing four	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
	front-line doublets in Asian patients with metastatic gastric cancer. Eur J Cancer 112 20-28	
14	Makiyama A, Shoji H, Kawakami H, Tamura T, Sugiyama K et al. (2023) O14-1 A randomized phase II study comparing S-1 plus oxaliplatin with S-1 monotherapy for elderly patients with advanced gastric cancer: WJOG8315G. Annals of Oncology 34 (Supplement 3): S1390	INTERVENTION/COMPARATOR
15	Fuchs CS, Shitara K, Di Bartolomeo M, Lonardi S, Al-Batran SE et al. (2019) Ramucirumab with cisplatin and fluoropyrimidine as first-line therapy in patients with metastatic gastric or junctional adenocarcinoma (RAINFALL): a double-blind, randomised, placebo-controlled, phase 3 trial. Lancet Oncol 20 (3): 420-435	INTERVENTION/COMPARATOR
16	Xu RH, Oh DY, Kato K, Arkenau HT, Tabernero J et al. (2023) 139MO Tislelizumab (TIS) plus chemotherapy (Chemo) vs placebo (PBO) plus chemo as first-line (1L) treatment of advanced gastric or gastroesophageal junction adenocarcinoma (GC/GEJC): Final analysis results of the RATIONALE-305 study. *Annals of Oncology* 34 (Supplement 4): S1526-S1527	NEWER DCO AVAILABLE
17	Kawakami H, Takeno A, Endo S, Makari Y, Kawada J et al. (2018) Randomized, Open-Label Phase II Study Comparing Capecitabine-Cisplatin Every 3 Weeks with S-1-Cisplatin Every 5 Weeks in Chemotherapy-	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
	Naive Patients with HER2-Negative Advanced Gastric Cancer: OGSG1105, HERBIS-4A Trial. Oncologist 23 (12): 1411-e1147	
18	Nishikawa K, Tsuburaya A, Yoshikawa T, Kobayashi M, Kawada J et al. (2018) A randomised phase II trial of capecitabine plus cisplatin versus S-1 plus cisplatin as a first-line treatment for advanced gastric cancer: Capecitabine plus cisplatin ascertainment versus S-1 plus cisplatin randomised PII trial (XParTS II). Eur J Cancer 101 220-228	INTERVENTION/COMPARATOR
19	Catenacci DVT, Tebbutt NC, Davidenko I, Murad AM, Al-Batran SE et al. (2017) Rilotumumab plus epirubicin, cisplatin, and capecitabine as first-line therapy in advanced MET-positive gastric or gastro-oesophageal junction cancer (RILOMET-1): a randomised, double-blind, placebo-controlled, phase 3 trial. Lancet Oncol 18 (11): 1467-1482	INTERVENTION/COMPARATOR
20	Shah MA, Shitara K, Ajani JA, Bang Y-J, Enzinger P et al. (2023) Zolbetuximab plus CAPOX in CLDN18.2-positive gastric or gastroesophageal junction adenocarcinoma: the randomized, phase 3 GLOW trial. Nature Medicine 29 (8): 2133-2141	INTERVENTION/COMPARATOR
21	Shah MA, Bang YJ, Lordick F, Alsina M, Chen M et al. (2017) Effect of Fluorouracil, Leucovorin, and Oxaliplatin With or Without Onartuzumab in HER2-Negative, MET-Positive Gastroesophageal	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
	Adenocarcinoma: The METGastric Randomized Clinical Trial. JAMA Oncol 3 (5): 620-627	
22	Shitara K, Lordick F, Bang YJ, Enzinger P, Ilson D et al. (2023) Zolbetuximab plus mFOLFOX6 in patients with CLDN18.2-positive, HER2-negative, untreated, locally advanced unresectable or metastatic gastric or gastro-oesophageal junction adenocarcinoma (SPOTLIGHT): a multicentre, randomised, double-blind, phase 3 trial. The Lancet 401 (10389): 1655-1668	INTERVENTION/COMPARATOR
23	Shah MA, Cho JY, Tan IB, Tebbutt NC, Yen CJ et al. (2016) A Randomized Phase II Study of FOLFOX With or Without the MET Inhibitor Onartuzumab in Advanced Adenocarcinoma of the Stomach and Gastroesophageal Junction. Oncologist 21 (9): 1085-1090	INTERVENTION/COMPARATOR
24	Hironaka S, Sugimoto N, Yamaguchi K, Moriwaki T, Komatsu Y et al. (2016) S-1 plus leucovorin versus S-1 plus leucovorin and oxaliplatin versus S-1 plus cisplatin in patients with advanced gastric cancer: a randomised, multicentre, open-label, phase 2 trial. Lancet Oncol 17 (1): 99-108	INTERVENTION/COMPARATOR
25	Ochenduszko S, Puskulluoglu M, Konopka K, Fijorek K, Urbanczyk K et al. (2015) Comparison of efficacy and safety of first-line palliative chemotherapy with EOX and mDCF regimens in patients with locally advanced inoperable or metastatic HER2-negative	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
	gastric or gastroesophageal junction adenocarcinoma: a randomized phase 3 trial. Med Oncol 32 (10): 242.	
26	Wainberg ZA, Enzinger PC, Kang YK, Qin S, Yamaguchi K et al. (2022) Bemarituzumab in patients with FGFR2b-selected gastric or gastro-oesophageal junction adenocarcinoma (FIGHT): a randomised, double-blind, placebo-controlled, phase 2 study. The Lancet Oncology 23 (11): 1430-1440	INTERVENTION/COMPARATOR
27	Xu J, Jiang H, Pan Y, Gu K, Cang S et al. (2023) Sintilimab Plus Chemotherapy for Unresectable Gastric or Gastroesophageal Junction Cancer: The ORIENT-16 Randomized Clinical Trial. JAMA 330 (21): 2064-2074	INTERVENTION/COMPARATOR
28	Iveson T, Donehower RC, Davidenko I, Tjulandin S, Deptala A et al. (2014) Rilotumumab in combination with epirubicin, cisplatin, and capecitabine as first-line treatment for gastric or oesophagogastric junction adenocarcinoma: an open-label, dose de-escalation phase 1b study and a double-blind, randomised phase 2 study. Lancet Oncol 15 (9): 1007-1018	INTERVENTION/COMPARATOR
29	Zaanan A, Bouche O, e la Fouchardiere C, Samalin-Scalzi E, Le Malicot K et al. (2023) LBA77 5-fluorouracil and oxaliplatin with or without docetaxel in the first-line treatment of HER2 negative locally advanced (LA) unresectable or metastatic gastric or	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
	gastro-esophageal junction (GEJ) adenocarcinoma (GASTFOX-PRODIGE 51): A randomized phase III trial sponsored by the FFCD. Annals of Oncology 34 (Supplement 2): S1318	
30	Zhang X, Wang J, Wang G, Zhang Y, Fan Q et al. (2023) LBA79 GEMSTONE-303: Prespecified progression-free survival (PFS) and overall survival (OS) final analyses of a phase III study of sugemalimab plus chemotherapy vs placebo plus chemotherapy in treatment-naive advanced gastric or gastroesophageal junction (G/GEJ) adenocarcinoma. Annals of Oncology 34 (Supplement 2): S1319	INTERVENTION/COMPARATOR
31	Zhao S, Su L, Chen Y, Li X, Lin P et al. (2022) Phase 2 randomized controlled trial of intravenous or intraperitoneal paclitaxel plus mFOLFOX6 vs. mFOLFOX6 as first-line treatment of advanced gastric cancer. Frontiers in Oncology 12 850242	INTERVENTION/COMPARATOR
32	Lordick F, Kang YK, Chung HC, Salman P, Oh SC et al. (2013) Capecitabine and cisplatin with or without cetuximab for patients with previously untreated advanced gastric cancer (EXPAND): a randomised, open-label phase 3 trial. Lancet Oncol 14 (6): 490-499	INTERVENTION/COMPARATOR
33	Yamada Y, Boku N, Mizusawa J, Iwasa S, Kadowaki S et al. (2019) Docetaxel plus cisplatin and S-1 versus cisplatin and S-1 in patients with advanced gastric	INTERVENTION/COMPARATOR

No.	Reference	Reason for exclusion
	cancer (JCOG1013): an open-label, phase 3, randomised controlled trial. Lancet Gastroenterol Hepatol 4 (7): 501-510	
34	(Web Page) A Study of SHR-1210 in Combination With Capecitabine + Oxaliplatin or Apatinib in Treatment of Advanced Gastric Cancer. Updated Available online at: https://clinicaltrials.gov/study/NCT03472365. Accessed: 2024	INTERVENTION/COMPARATOR

H.1.7 Quality assessment

A key strength of this SLR was its adherence to best practices for the conduct and reporting of systematic reviews. Notably, all searches were performed by an experienced medical information specialist and peer-reviewed by a second information specialist. As per the PRISMA statement, the current review reports detailed search strategies, PICOS, a PRISMA flow diagram and full included/excluded study lists.

A limitation of this SLR was that the language was restricted to include English-only articles at the study selection stage. Given that most of the key studies identified were published in English journals, it is likely that this was a minor limitation. However, it should be noted that this restriction was not applied to the search strategy.

K.2 RATIONALE-305

K.2.1 Final analysis (DCO February 2023)

K.2.1.1 Overall survival

ITT population: TIS + CT was associated with a median OS of 15.0 months [95% CI: 13.6 to 16.5] versus 12.9 months [95% CI: 12.1 to 14.1] for PBO + CT in the final analysis. In the ITT population Cox regression models were stratified by region (East Asia versus Europe/North America), PD-L1 expression (all randomized patients only), and presence of peritoneal metastasis. The stratified hazard ratio (HR) for mortality was 0.80 [95% CI: 0.70 to 0.92; P = 0.001] in favor of TIS + CT. The TIS + CT arm yielded a higher OS rate than the PBO + CT arm, indicating a sustained OS benefit associated with TIS + CT in the ITT population [44]. The median follow-up times by reverse Kaplan-Meier methodology were 32.9 months [95% CI: 30.5 to 35.2] and 32.5 months [95% CI: 31.2 to 35.0] for the TIS + CT arm and the PBO + CT arm, respectively, as seen in a confidential internal CSR [7]. The Kaplan-Meier plot is presented in Appendix B.

K.2.1.2 Progression-free survival

ITT population: As of the DCO in February 2023, 311 (62%) patients progressed in the TIS + CT arm and 354 (71.4%) in the PBO + CT arm. The median PFS for TIS + CT was 6.9 months [95% CI: 5.7 to 7.2] and 6.2 months [95% CI: 5.6 to 6.9] for the PBO + CT arm (stratified HR = 0.78 [95% CI: 0.67 to 0.90]). The Kaplan-Meier curves began to separate at approximately 9 months in favor of TIS + CT [44]. PFS results in the ITT population at the final analysis are presented in Appendix B.

K.2.2 Close-out data (DCO August 2024)

K.2.2.1 Overall survival

ITT population: The updated OS results in this data-cutoff were consistent with the final analysis results and continued to show clinically meaningful OS improvement with TIS + CT versus PBO + CT in the ITT population. Results are presented in Table 80.

Table 80. Overall survival in the ITT population (RATIONALE-305, DCO August 2024)

	TIS + CT (n = 501)	PBO + CT (n = 496)
Death, n (%)	[redacted]	[redacted]
Median OS, months (95% CI)	[redacted]	[redacted]

Median follow-up time, months (95% CI)	[redacted]	[redacted]

Notes: Medians and other quartiles were estimated by Kaplan-Meier method with 95% CIs estimated using the method of Brookmeyer and Crowley. OS rates were estimated by Kaplan-Meier method with 95% CIs estimated using the Greenwood's formula. Median follow-up time was estimated by the reverse Kaplan-Meier method. [a]Stratified by regions (east Asia versus Europe/North America), PD-L1 expression and presence of peritoneal metastasis. Source: All data in the table above was sourced from an internal CSR [7].

K.2.2.2 Progression-free survival

K.3 CheckMate 649

At DCO 27 May, 2021, OS with NIV + CT versus CT was observed in all randomized patients; median OS was 13.8 months (95% CI: 12.4-14.5) versus 11.6 months (95% CI: 10.9-12.5), respectively, with a 21% reduction in the risk of death versus CT (HR 0.79; 95% CI: 0.71-0.88). A PFS benefit was observed with NIV + CT versus CT in all randomized patients (HR 0.79; 95% CI: 0.70–0.89). At 3-year follow-up, with 36.2 months minimum follow-up, results in the overall population were consistent with those in the PD-L1 CPS ≥5 in which NIV + CT showed improvement in OS and PFS versus CT [54]. At the 48 months minimum follow-up, NIV + CT continued to demonstrate OS and PFS benefit vs CT in all randomized patients (Table 81) [67].

Table 81. 48-month follow-up results in ITT population - CheckMate 649

	ITT population	
	NIV + CT	CT
	(n = 789)	(n = 792)

Median OS, months (95% CI)	13.7 (12.4–14.5)	11.6 (10.9–12.5)
HR (95% CI)	0.79 (0.71–0.88)	
48-month OS rate, % (95% CI)	13 (11–16)	8 (6–10)
Median PFS[a], months (95% CI)	7.7 (7.1–8.6)	6.9 (6.7–7.2)
HR (95% CI)	0.80 (0.71–0.89)

Appendix L. Rest of World (non-Asia) subgroup analyses

L.1 RATIONALE-305

L.1.1 Overall survival

Tislelizumab plus CT improved OS in the European and North American subpopulation in the PD-L1 ≥5% population.

The unstratified HR favored Tislelizumab plus CT in the European and North American subpopulation in the PD-L1 ≥5% population (HR = 0.75 [95% CI: 0.52 to 1.07]) and the ITT Set (HR = 0.71 [95% CI: 0.54 to 0.94]) (Table 82) [71].

Table 82. Overall survival in the European and North American subpopulation at final analysis, RATIONALE-305

	TIS + CT	PBO + CT
Overall survival in the European and North American subpopulation		
PD-L1 ≥5% Set		
OS events/Patients (n)	57/72	62/71
Median OS (95% CI), months	10.2 (7.5 to 15.0)	10.7 (7.9 to 12.8)
Unstratified OS HR (95% CI) [a]	0.75 (0.52 to 1.07)	
ITT Set		
OS events/Patients (n)	96/125	108/124
Median OS (95% CI), months	11.0 (8.4 to 13.9)	10.5 (8.1 to 12.1)
Unstratified OS HR (95% CI) [a]	0.71 (0.54 to 0.94)	

[a] Hazard Ratio and its 95% CI were estimated from unstratified Cox regression model including treatment as covariate. Source: **[71]**.

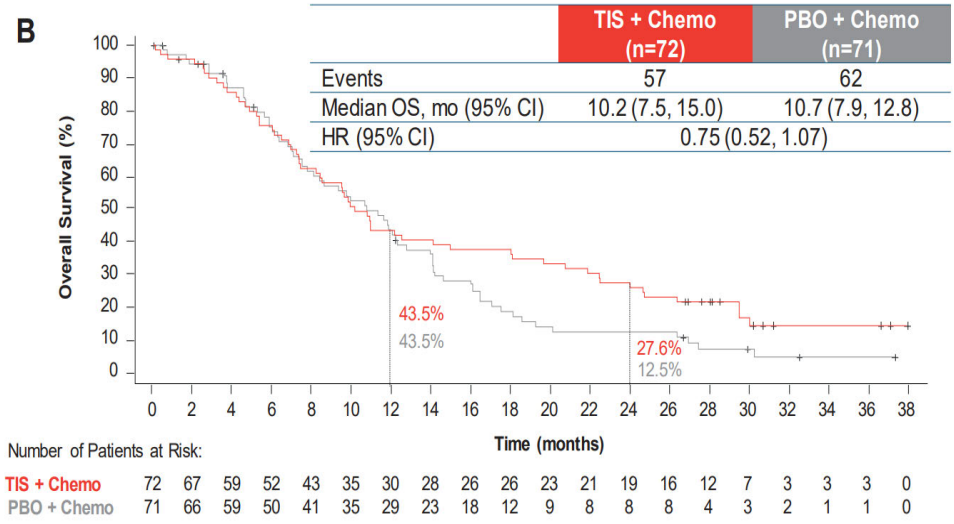

Figure 23. Kaplan-Meier data for overall survival in the European and North American PD-L1 ≥5% subpopulation at DCO February 2023, RATIONALE-305

*Log-rank and Cox regression models were stratified by regions (Asia versus Europe/North America), PD-L1 expression (ITT population analysis only), and presence of peritoneal metastasis. P-values are one-sided and based on the stratified log-rank test. P-value boundary at final analysis is 0.0226. Medians were estimated by the Kaplan-Meier method with 95% CIs estimated using the method of Brookmeyer and Crowley. OS rates were estimated by the Kaplan-Meier method. Source: The Kaplan-Meier data was sourced from an internal EVD [7].

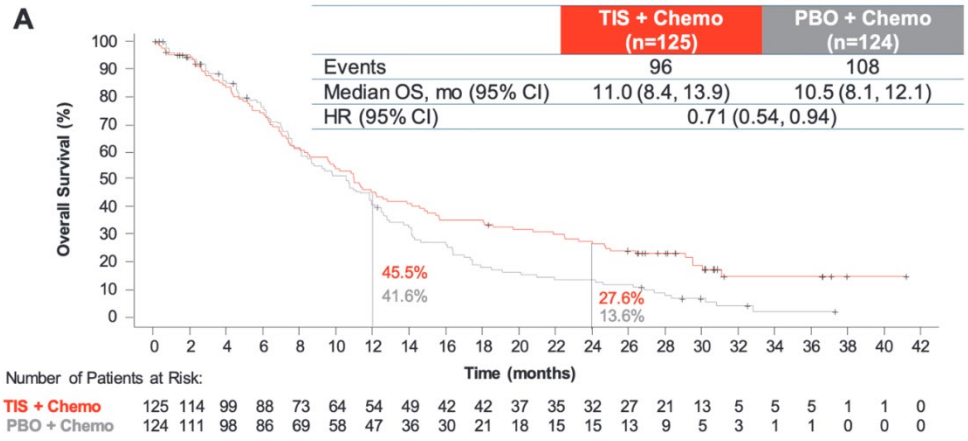

Figure 24. Kaplan-Meier data for overall survival in the European and North American ITT analysis set at DCO February 2023, RATIONALE-305

*Log-rank and Cox regression models were stratified by regions (Asia versus Europe/North America), PD-L1 expression (ITT population analysis only), and presence of peritoneal metastasis. P-values are one-sided and based on the stratified log-rank test. P-value boundary at final analysis is 0.0226. Medians were estimated by the Kaplan-Meier method with 95% CIs estimated using the method of Brookmeyer and Crowley. OS rates were estimated by the Kaplan-Meier method. Source: The Kaplan-Meier data was sourced from an internal EVD [7].

L.1.2 Progression-free survival

The unstratified HR of tislelizumab plus CT versus placebo plus CT in the European and North American subpopulation in the PD-L1 ≥5% population was [redacted] (Table 83 and Figure 25) and in the ITT Set 0.84 [95% CI: 0.63 to 1.11] at the time of the final DCO (Table 83). The small patient population in this subgroup is likely the reason for the large CIs, which cross the line of no effect [7].

Table 83. Progression-free survival in the European and North American subpopulation at final analysis, RATIONALE-305

	PD-L1 ≥5% Set		ITT Set	
	TIS + CT (n =72)	PBO + CT (n =71)	TIS + CT (n =125)	PBO + CT (n =124)
Progressive Disease, n (%)	[redacted]	[redacted]	[redacted]	[redacted]
Death, n (%)	[redacted]	[redacted]	[redacted]	[redacted]
Median PFS, months (95% CI)	[redacted]	[redacted]	5.6 (4.4, 7.0)	5.4 (4.3, 5.9)
Unstratified HR (95% CI)[a]	[redacted]		0.84 (0.63,1.11)	

Source: All data in the table above was sourced from an internal EVD [7].

Figure 25. Kaplan-Meier curve of progression-free survival in the European and North American subpopulation with PD-L1 ≥5% at final analysis, RATIONALE-305

Notes: Arm A = Tislelizumab + Chemotherapy, Arm B = Placebo + Chemotherapy. Hazard Ratio was based on unstratified Cox regression model. '+' = censored. Source: The Kaplan-Meier data was sourced from an internal EVD [7].

L.2 CheckMate 649

L.2.1 Overall survival

At 3-year follow-up (DCO May 2022) in CheckMate 649, the HRs for OS favored nivolumab plus CT over CT in the prespecified subgroup ROW in patients with PD-L1 CPS ≥5 (n=590) and in the overall population (n=962). The unstratified HR for OS with nivolumab plus CT vs CT in the PD-L1 CPS ≥5 population was 0.74 [95% CI: 0.62 to 0.88].

In the ITT population the unstratified HR for OS with NIV + CT vs CT was 0.83 [95% CI: 0.72 to 0.95] [54].
